Stecon Group: Mission 2030

Vision Consulting

Arnav

Bella

Adeline

James

Executive Summary

Situation

How can STECON strengthen its core business, expand into new growth opportunities, and execute over five years to achieve Mission 2030?

Solution

Duel-Engine Growth Strategy

1. Higher-Value Construction
Prioritize data centers while protecting STECON's infrastructure backbone

2. Recurring Water Platform
Scale water through partnerships and ownership to diversify earnings

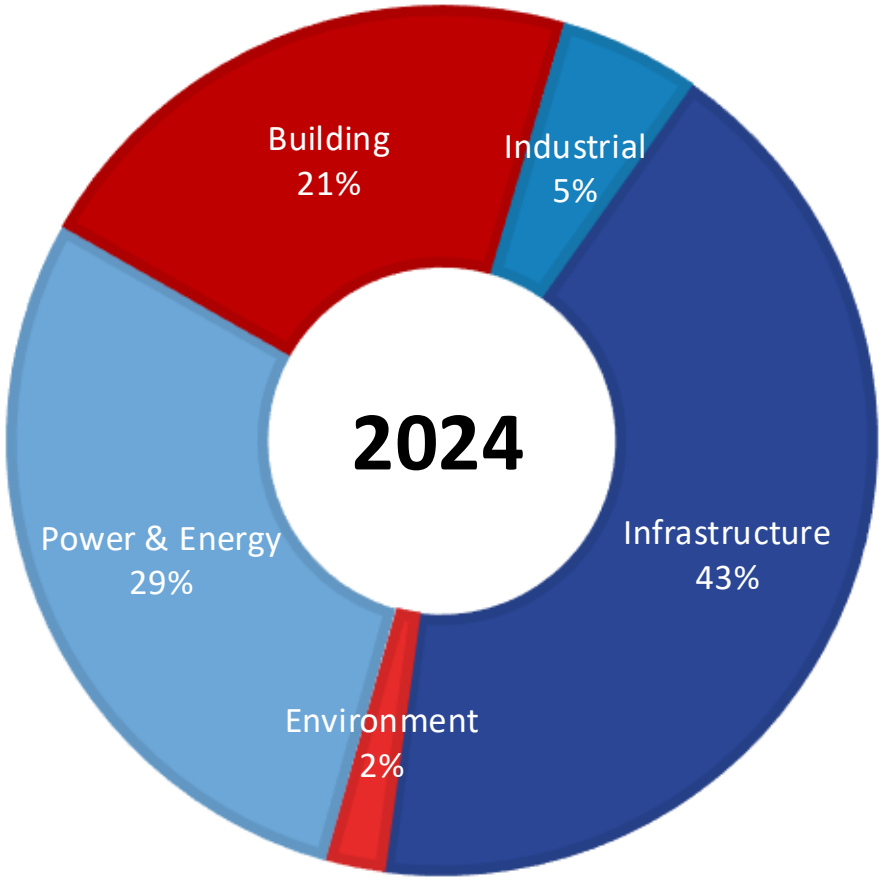

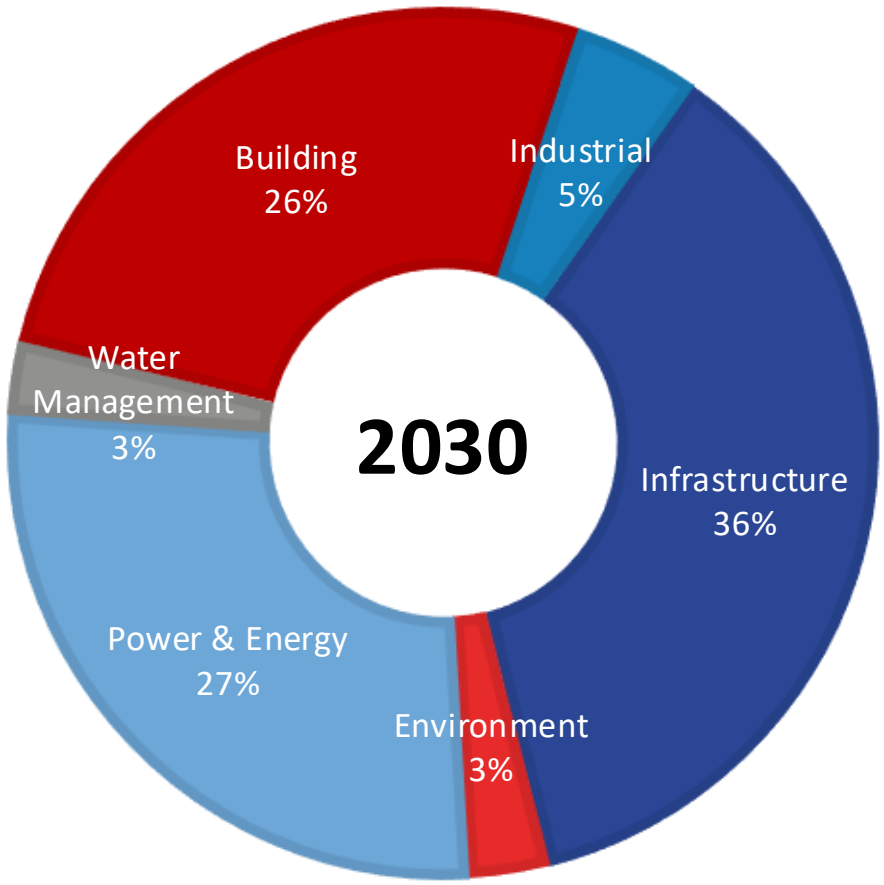

Impact

THB 45.7bn	7.6%	5.3%
Revenue In 2030	Gross Margin In 2030	Net Margin In 2030

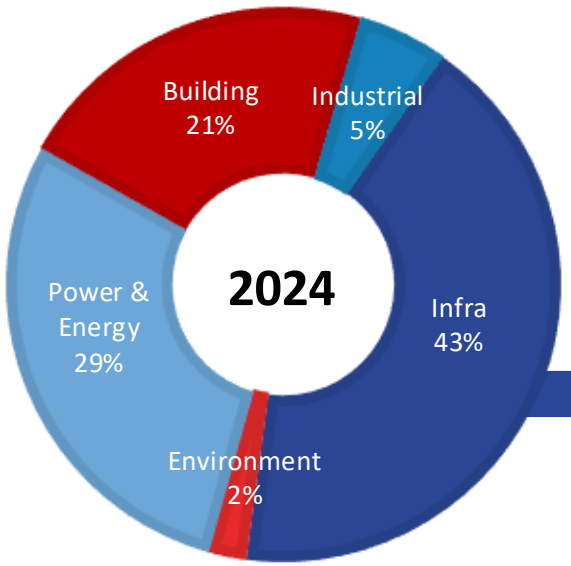

STECON Can Reach Mission 2030 by Rebalancing, Not Rebuilding, Its Portfolio

Source: MordorIntelligence

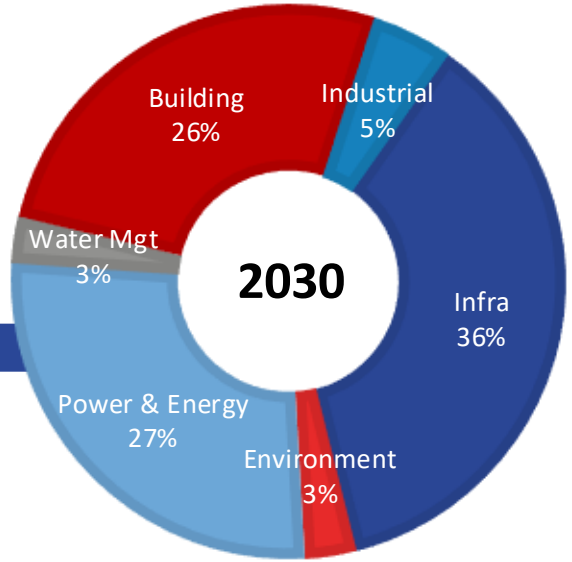

01 Fuel

How can STECON strengthen its core by shifting incremental growth toward higher-value data-center construction?

02 Ignite

How can STECON build a new recurring growth engine by scaling water management?

STECON's core capabilities create a right to win in complex infrastructure

STECON has built deep expertise delivering complex, large-scale infrastructure across Thailand over six decades

STECON combines **public-infrastructure scale with private-sector expertise** in power and industrial projects

STECON's **execution credibility creates a foundation** to expand into higher-value, technically complex adjacencies

Leveraging Core Competencies

Brand Trust

Scale Delivery

Complex EPC

Key Goals

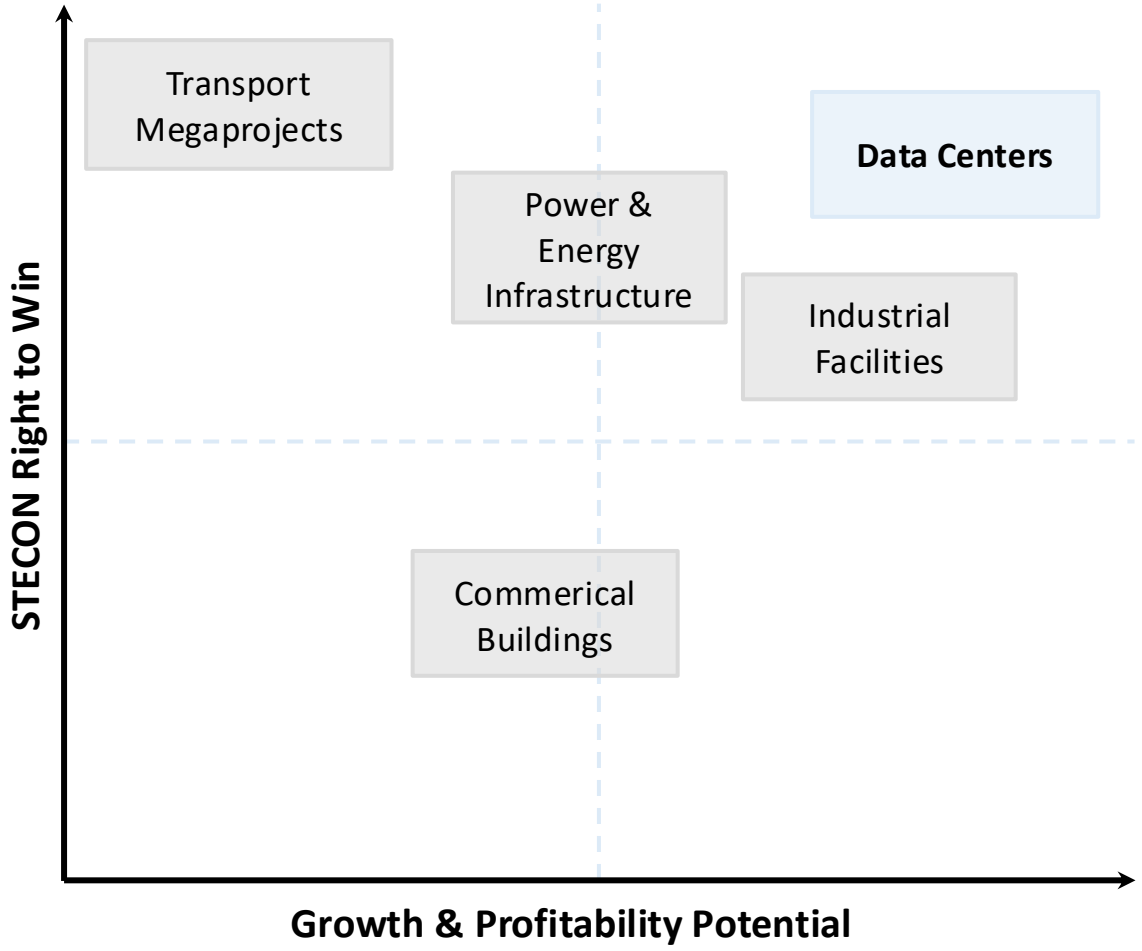

1 **Protect Core Economics**
Prioritize technically differentiated projects that reduce price-based competition and support stronger margins

2 **Capture Adjacent Growth**
Deploy existing capabilities into fast-growing infrastructure segments where STECON can credibly differentiate

Leverage STECON's EPC strengths to shift incremental growth toward higher-value, differentiated infrastructure projects

Data centers offer STECON the clearest whitespace for profitable private-sector construction growth

Construction Project White-Space Analysis

Why Data Centers Win

Attractive Growth Market

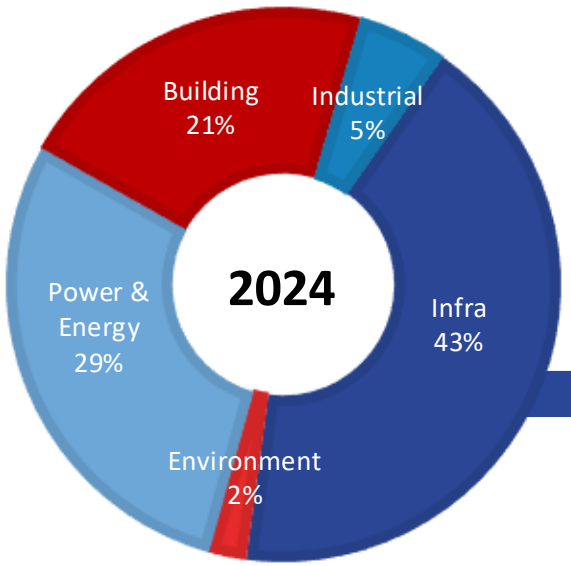

Private-Sector Economics
Private projects offer greater margin potential and compete beyond lowest-price bidding

Explosive Investment Portfolio
THB728B across 36 Thai data-center investment applications in 2025

STECON Has a Right to Win

Integrated EPC Capability
Existing expertise across complex construction, water, and large-scale infrastructure

Existing Market Foothold
STECON already targets built-to-suit hyperscale projects and has digital-infrastructure investments

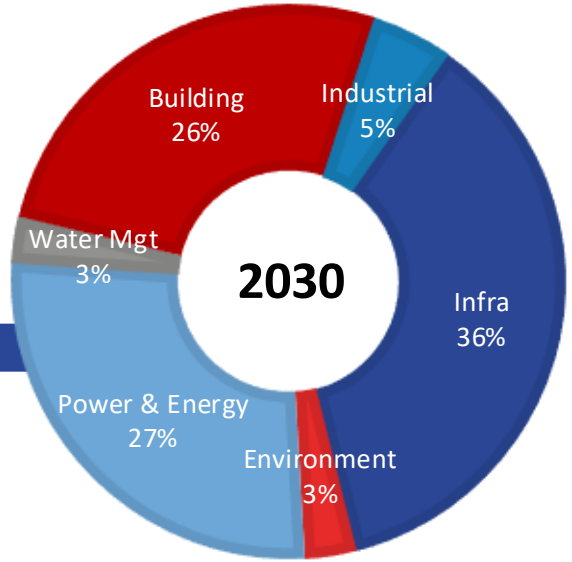

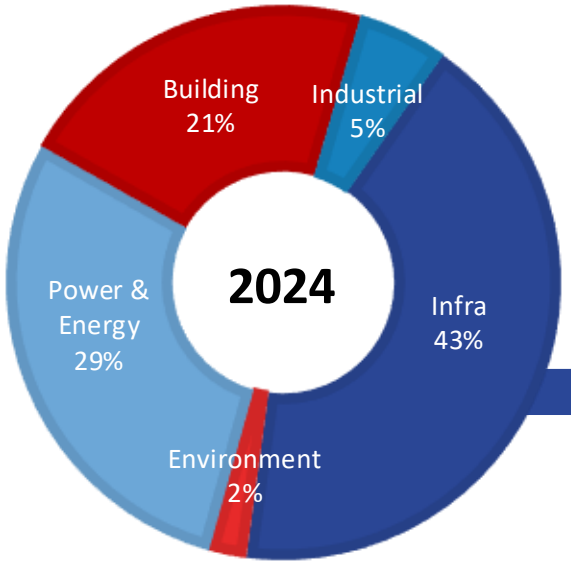

01 Fuel

How can STECON build a new recurring growth engine by scaling water management?

Evaluate contracts based on financial guardrails and ecosystem fit to selectively pursue them.

Strategic Objective Strengthen and standardize STECON's existing bid process around explicit margin, cash, and risk thresholds

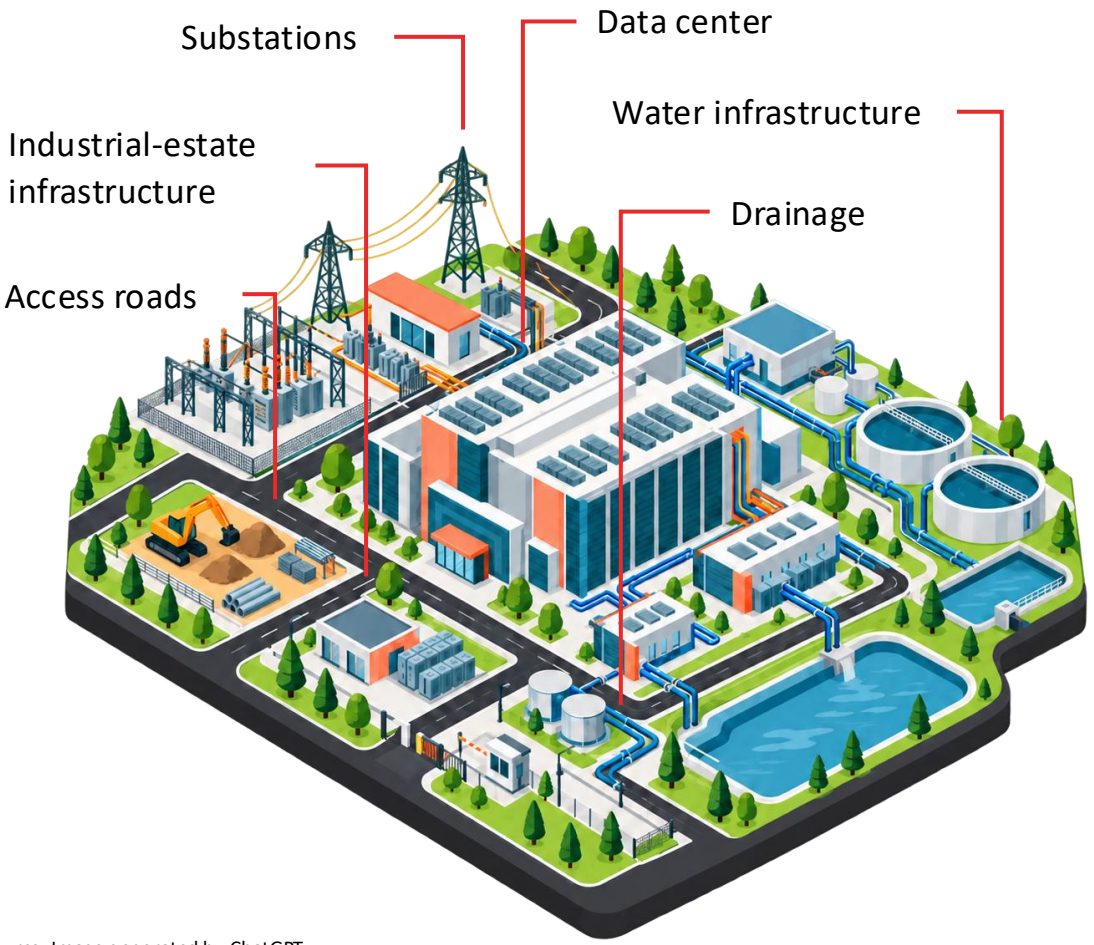

Proposed Financial Guardrails

1. **Risk-adjusted margin**
   > **5% risk-adjusted gross margin**; target approx. **7% before risk adjustments**[1]
2. **Payment certainty**
   Payment within **45 days** of certification, financial guarantee for higher-risk private customers[2]
3. **Working-capital requirement**
   Base-case cash neutral; downside funding requirement fully covered by committed liquidity
4. **Execution/ contract risk**
   Delay damages capped at approx. **10%**[4]

Evaluate contracts based on financial guardrails and ecosystem fit to selectively pursue them.

Strategic Objective Prioritize profitable EEC projects that strengthen STECON's data-center delivery capabilities

Source: Image generated by ChatGPT

How Adjacent Projects Strengthen the Platform

Local Knowledge

Site conditions, permits, logistics & utility connections

Reusable Network

Proven civil, electrical, MEP & water partners

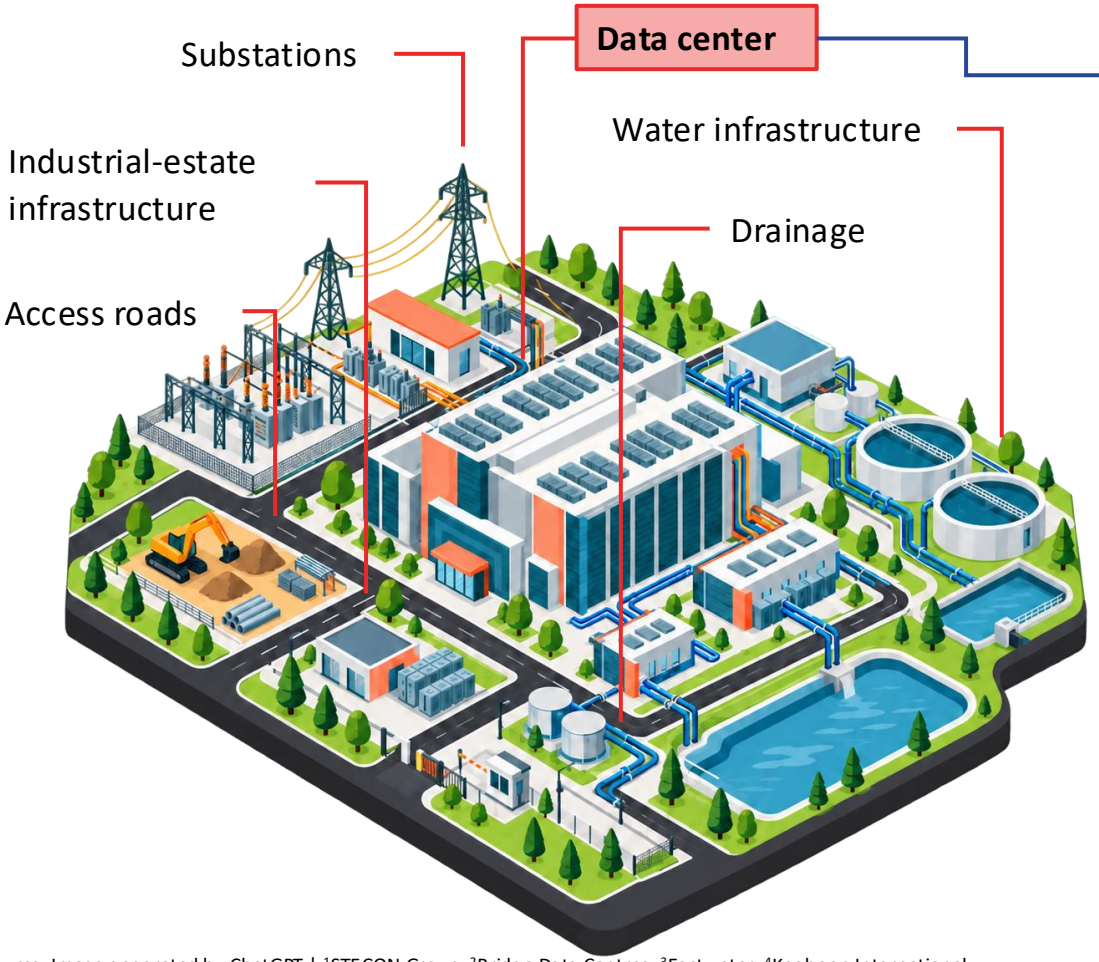

Stakeholder Relationships

Utilities, industrial estate developers & data-center operators

Better-informed bids, faster mobilization, and stronger positioning for future campus phases

STECON should anchor its portfolio around global operators with multi-phase data-center campuses in Thailand.

Strategic Objective Prioritize projects that deepen local delivery capabilities and position STECON for subsequent campus phases

Global Operators

Why Them?	Why Us?
Recurring development pipeline	Scaled project evidence
Multi-phase campuses	Access to adjacent infrastructure
Need for local delivery expertise	Need for local delivery expertise

Examples:

BDC DAYONE empyrion digital

Source: Image generated by ChatGPT | [1]STECON Group; [2]Bridge Data Centres; [3]Eastwater; [4]Kaohoon International

A permanent delivery platform converts STECON's project capabilities into a repeatable customer proposition

Strategic Objective Prioritize projects that deepen local delivery capabilities and position STECON for subsequent campus phases

	Design Coordination	Construction & MEP	Equipment Interfaces	Testing & Handover
Operators	• Technical requirements • Design approval • Global engineering standards	No involvement	• Equipment specifications • Vendor selection • Major equipment purchasing	• Final acceptance
STECON	• Early construction review • Thai permit and code • Construction sequencing • Site & logistics planning	• Civil & structural works • MEP installation and coordination • Subcontractor delivery • Cost, schedule and risk control	• Receiving and installation readiness • Building and equipment interfaces • Energization dependencies	• Early commissioning planning • Functional testing coordination • Handover documentation

A permanent delivery platform converts STECON's project capabilities into a repeatable customer proposition

Strategic Objective Prioritize projects that deepen local delivery capabilities and position STECON for subsequent campus phases

Design Coordination

Construction & MEP

Equipment Interfaces

Testing & Handover

Delivery Team

Platform director supported by mission-critical MEP, project controls and commissioning specialists

Review Constructability Earlier
identifying local permitting, sequencing, and installation issues before they create delays

Specialist Partner Network
Prequalified MEP, cooling, controls and testing firms with tracked capacity and performance

Knowledge Retention
Customer standards, lessons learned, cost data and tested construction sequences retained for later phases

A 5-year implementation timeline to develop and scale a delivery platform

Strategic Objective — Build the minimum viable platform and establish performance baselines

TASKS	2025		2026		2027		2028		2029		onward
	H1	H2	H1	H2	H1	H2	H1	H2	H1	H2	
Fuel – Phase 1	Forming the team										
Fuel – Phase 2			Standardizing processes		Deploy playbook across active projects						
Fuel – Phase 3							Improve framework and partnership network, while extending ecosystem				

Build

Prove

Scale

Year one focuses on establishing the team, standardizing delivery, and proving the platform on live projects.

Strategic Objective

Build the minimum viable platform and establish performance baselines

TASKS	2025		2026		2027		2028		2029		onward
	H1	H2	H1	H2	H1	H2	H1	H2	H1	H2	
Fuel – Phase 1	Forming the team										
Fuel – Phase 2		Standardizing processes	Deploy playbook across active projects								
Fuel – Phase 3							Improve framework and partnership network, while extending ecosystem				

1: Build

- Appoint a data-center delivery director
- Hire selectively and redeploy leaders
- Capture existing knowledge of contracts, requirements, and risks
- Pilot standardize processes on live projects

KPIs

- 100% live projects onboarded
- 2+ partners per segment
- Performance baseline established

Years two and three use measured delivery gains to win earlier roles and repeat phases.

Strategic Objective — Convert verified performance into earlier involvement and subsequent-phase awards

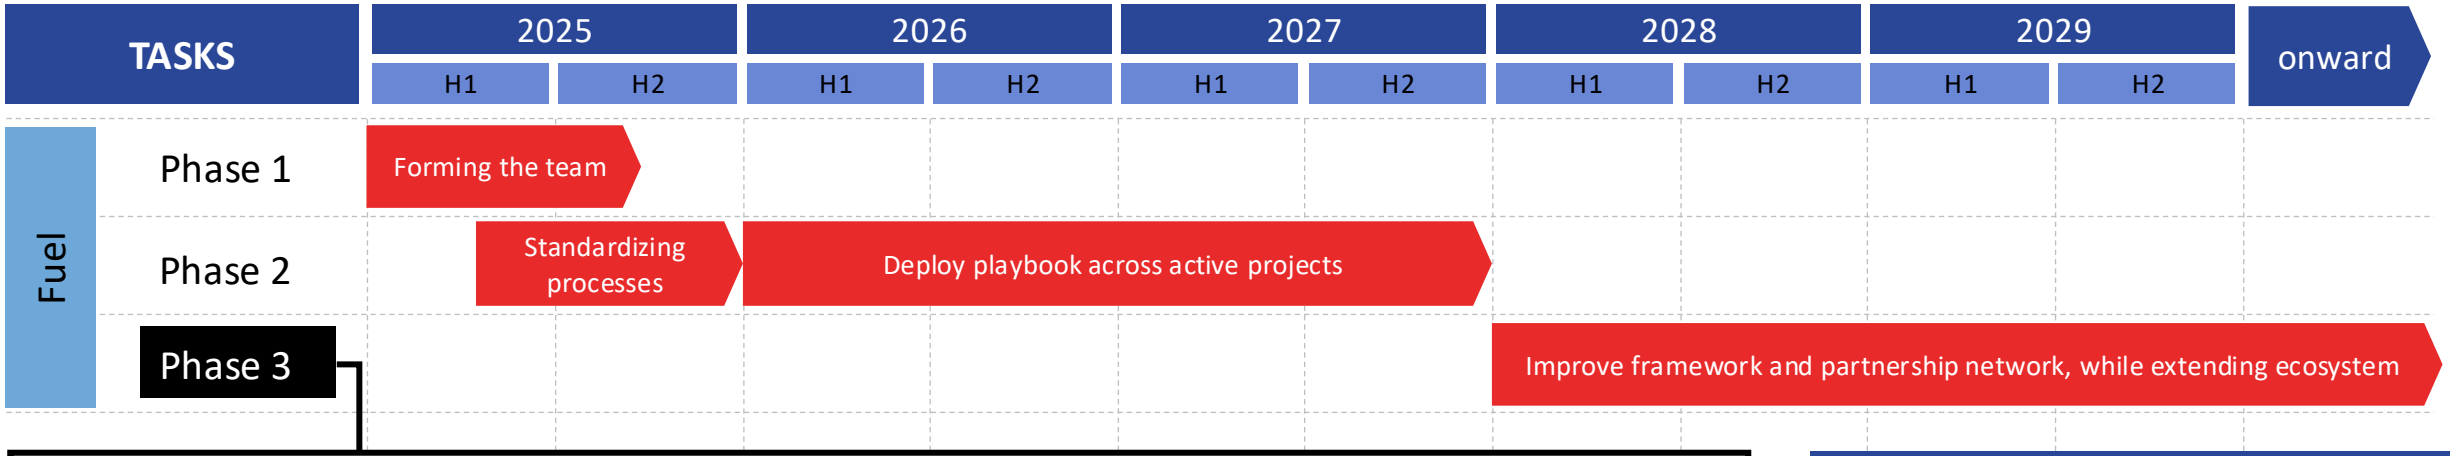

TASKS	2025		2026		2027		2028		2029		onward
	H1	H2	H1	H2	H1	H2	H1	H2	H1	H2	
Fuel — Phase 1	Forming the team										
Fuel — Phase 2	Standardizing processes		Deploy playbook across active projects								
Fuel — Phase 3							Improve framework and partnership network, while extending ecosystem				

2: Prove

- Deploy across projects using playbook
- Strengthen partner network
- Offer constructability and local-delivery input
- Pursue later phases using demonstrated project results

Years four and five scale the proven platform across operators, campuses, and adjacent infrastructure projects

Strategic Objective Diversify customer exposure and make repeat data-center delivery a meaningful contributor to backlog

3: Scale

- Expand across global operators and selectively bid for hyperscaler projects
- Use historical performance to improve future bids and schedules
- Pursue profitable power, water and site-infrastructure projects around data-center clusters

KPIs

- 2+ global operator relationships
- 50% repeat-phase award share
- Performance baseline established

STECON's understanding of the operator makes it a strong candidate for future phases.

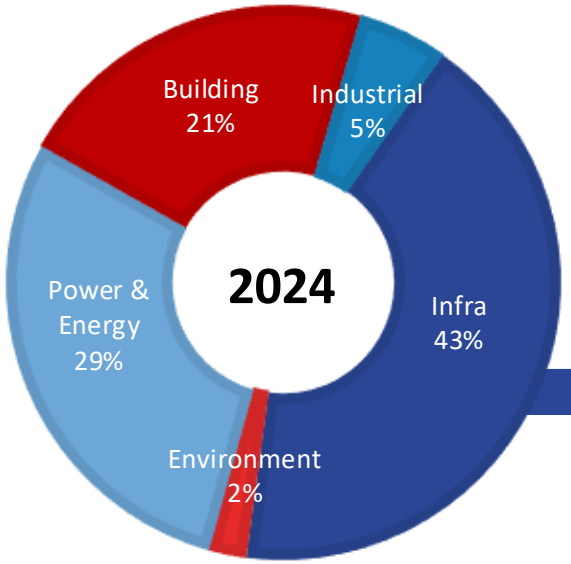

Securing Following Contracts

Understanding of operator's standard, approval process, partners etc…

Reduces…

- Relearning
- Execution risk

STECON Can Scale Water Through Partnership and Controlled Ownership

Two Ownership Pathways for Water Expansion

EAST WATER STECON
UTILITIES COMPANY LIMITED

EWS combines STECON's engineering capabilities with East Water's established water network and operating expertise

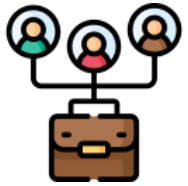

Co-Ownership: EWS Precedent

Shared Investment

40% STECON stake spreads capital requirements and project risk with East Water

Complementary Expertise

STECON provides engineering capabilities while East Water contributes water operations and network access

Contracted Demand

Long-term industrial supply agreements secure demand before infrastructure is fully scaled

Controlled Ownership: Mars Precedent

1. **Strategic Control**
   51% ownership gives STECON majority control over investment and expansion decisions

2. **Operating Platform**
   Existing water-production assets provide an immediate base for regional expansion

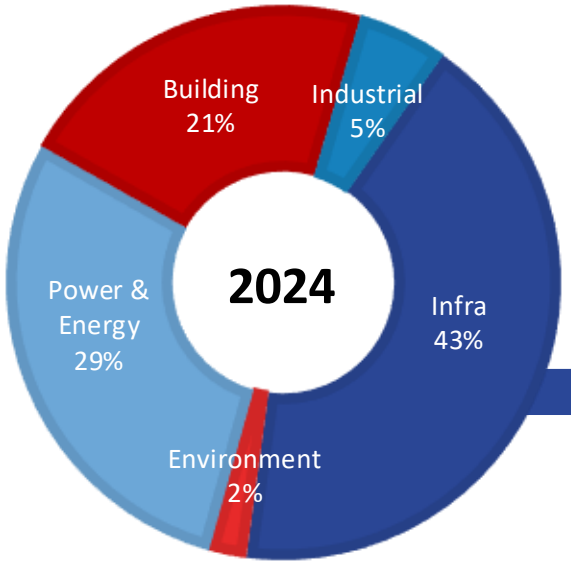

3. **Recurring Revenue**
   Long-term industrial supply contracts create predictable revenue beyond one-off construction projects

4. **Expansion Optionality**
   STECON can reinvest into additional plants, customers, and adjacent industrial clusters

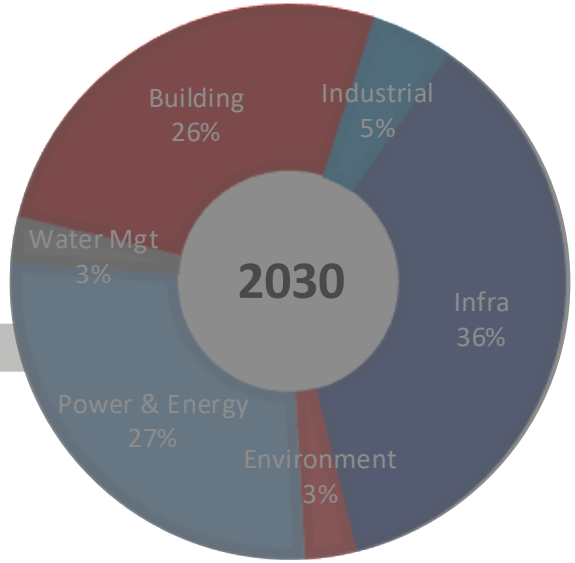

01 Fuel

How can STECON strengthen its core by shifting incremental growth toward higher-value data-center construction?

02 Ignite

How can STECON build a new recurring growth engine by scaling water management?

Stecon's acquisition of a majority stake in Mars Water Supply provides a strong framework for future investments

Strategic Objective Repeat strategic success in acquiring other water management companies using key factors of Mars Water Supply

Scalable Contract Base

Prior to their acquisition, MWS had **three long-term contracts pre-established** with the Industrial Estate Authority of Thailand[1]

Long-Term Strategic Fit

As an experienced industrial water distributor, MWS allowed Stecon to expand estate services from just system construction to **full cycle management**

Investment Size

Stecon's **317MB majority stake** in MWS equated to 51%, giving then majority control while being a manageable investment size[2]

Source: 1 Case, 2 Stecon Group Co

The EEC has several potential water management companies that meet Stecon's selection criteria

Strategic Objective

Partners would benefit from Stecon's size and expanse across industrial estates in Thailand

Industrial Water Resource Management[1]

บริษัท ไอดับบลิวอาร์เอ็ม จำกัด
IWRM CO.,LTD.

- Contracted with several industrial estates already operating within the EEC with 66,000 cubic meters of water management per day
- IWRS currently handles wastewater management in Chonburi and Chacheongsao with plans to expand
- Assumed total value at 590M B is a manageable size for Stecon with future project priority

How does the partner benefit?

Project Size Growth

Ability to take on projects larger than current financial capability

Operational Ownership

Retained ownership and operational independence outside of Stecon

Expansion Across EEC

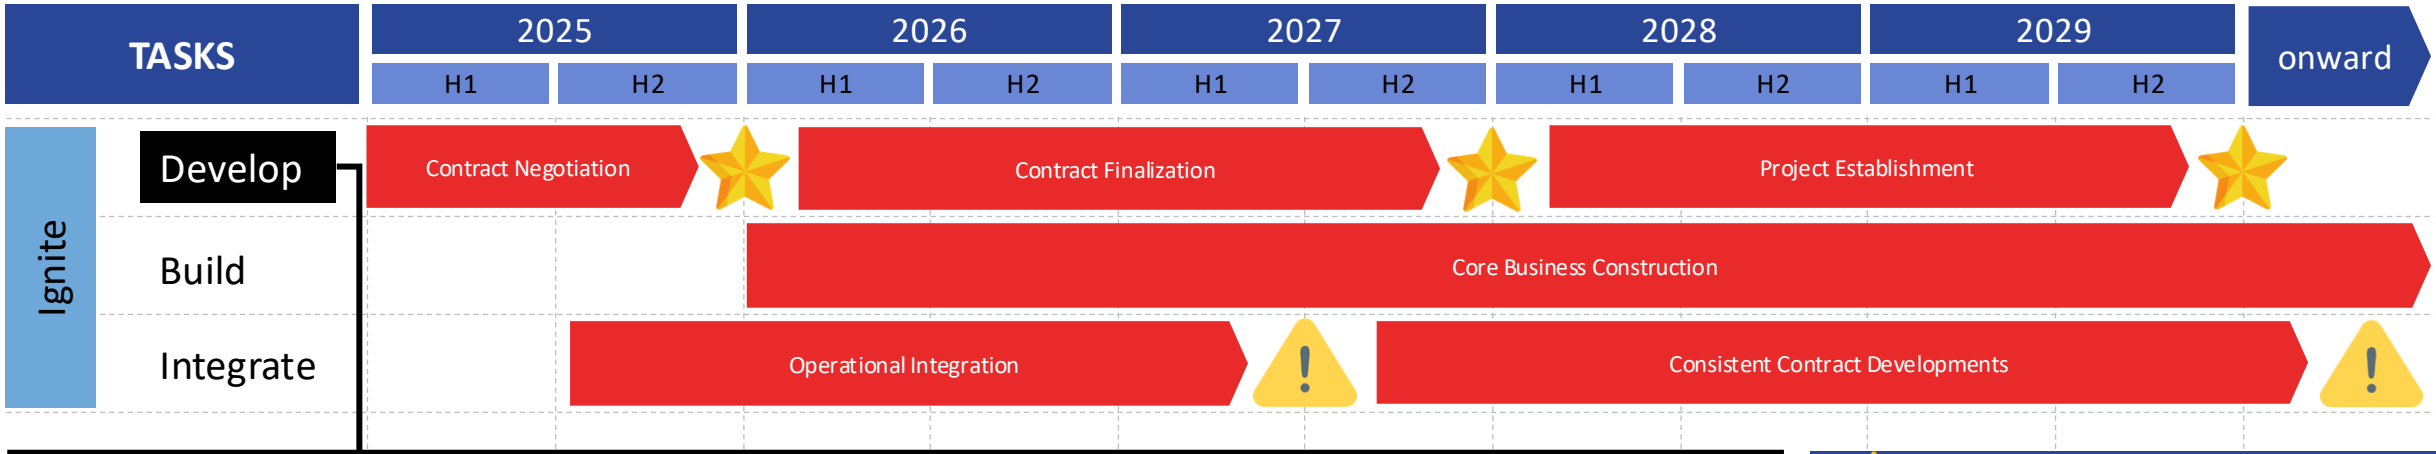

Ability to bid on and operate larger industrial estates across the EEC and growing industrial areas

Source: 1 IWRM

Once acquiring stake in these water management companies, Stecon can achieve growth alongside development in the EEC

Strategic Objective

Optimize acquisition negotiations and operational merging across the next 5 years

Develop

- Build target list considering growing operators within EEC
- Present partnership proposals at 51% base ownership
- Conduct diligence and operational transfers with current partner contracts
- Determine future contracts for Stecon to lead construction

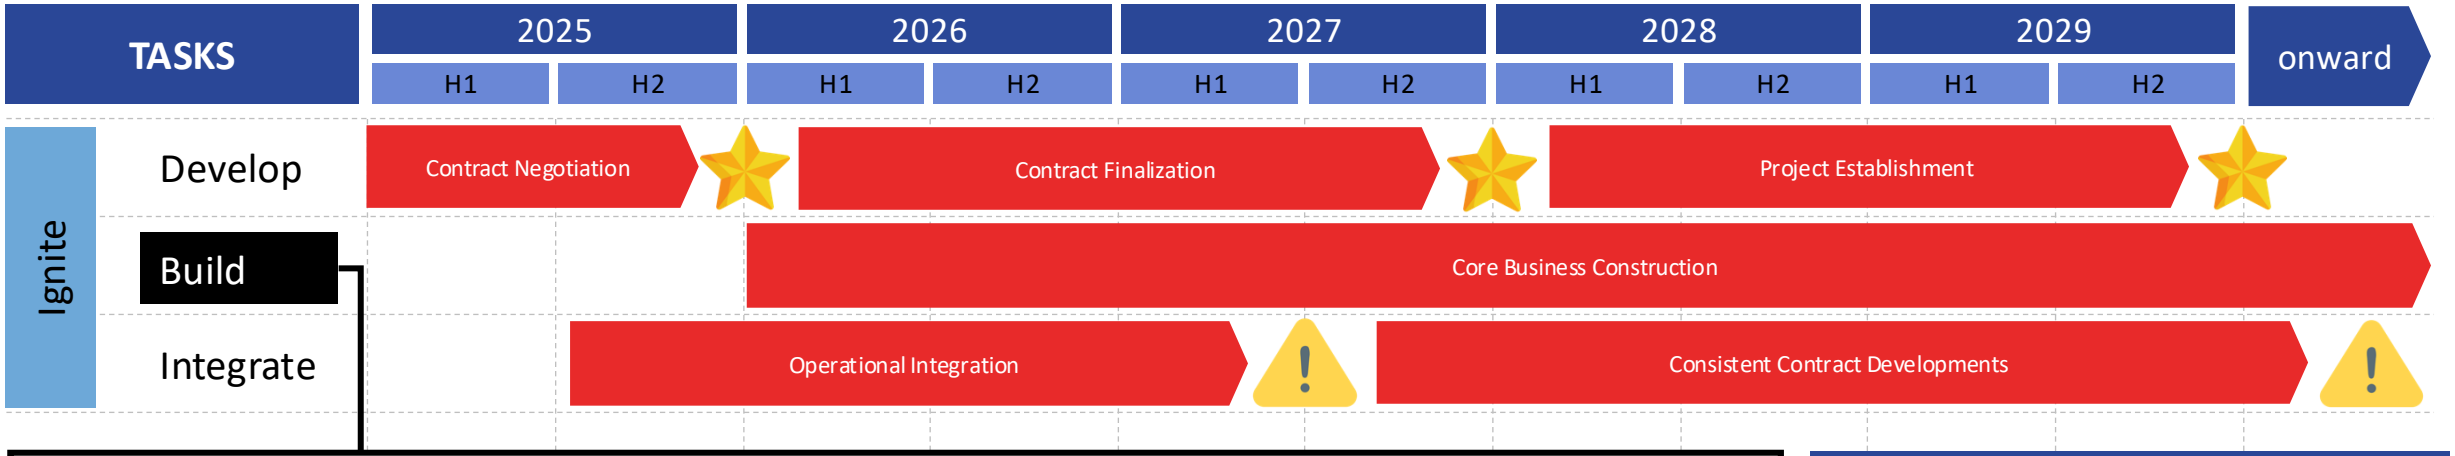

Contract Success Checks

1	3 Contracts
3	7 Contracts
5	12 Contracts

Once acquiring stake in these water management companies, Stecon can achieve growth alongside development in the EEC

Strategic Objective

Optimize acquisition negotiations and operational merging across the next 5 years

Build

- Design water facilities with partner performance in consideration
- Secure approvals and necessary permits for EEC builds
- Build infrastructure and construct reservoirs
- Facility handover once projects are properly tested and managed

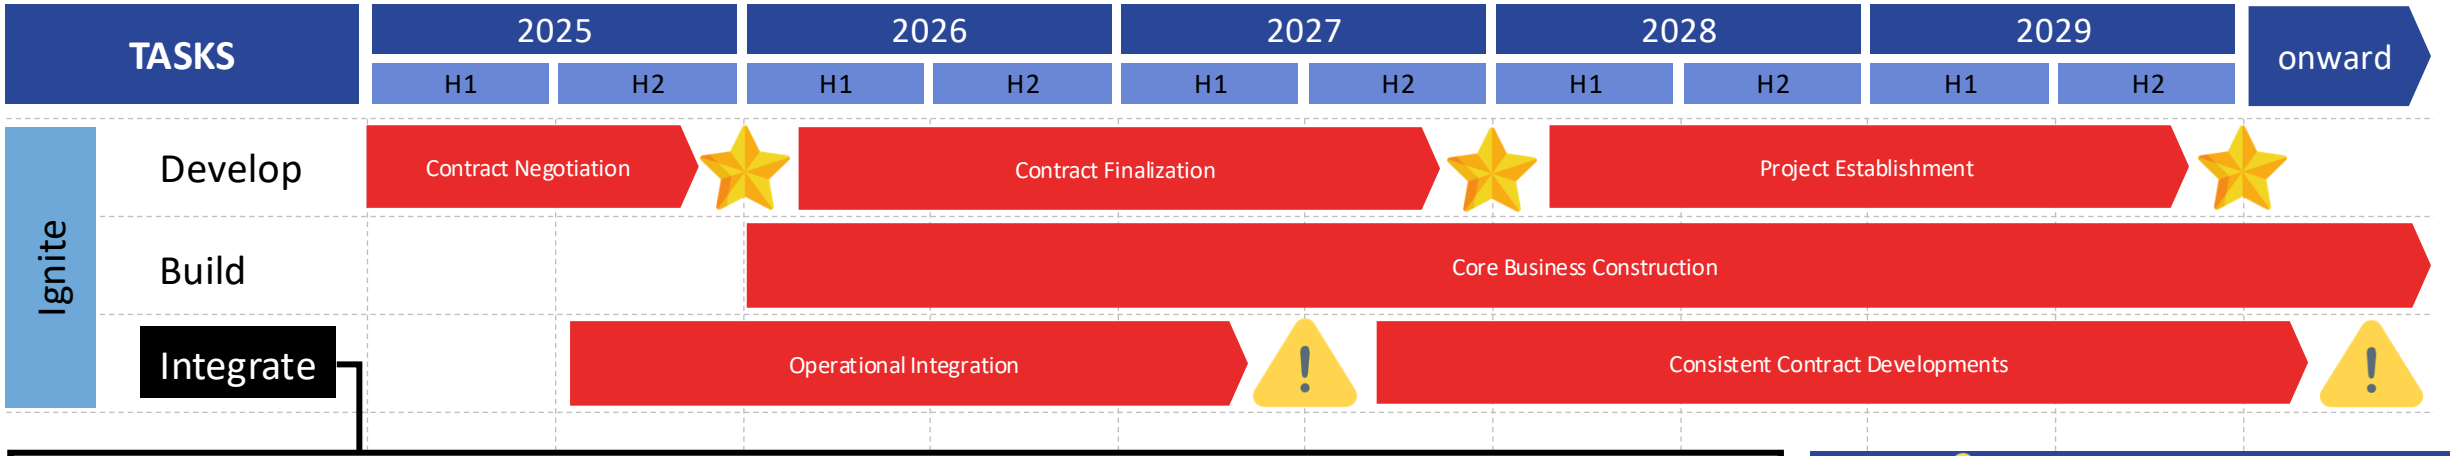

KPIs

- Schedule performance & accuracy
- Construction cost control
- Industrial estate wide systems

Once acquiring stake in these water management companies, Stecon can achieve growth alongside development in the EEC

Strategic Objective

Optimize acquisition negotiations and operational merging across the next 5 years

Integrate

- Integrate with partner operating teams
- Monitor service quality between partner and industrial estates
- Reduce water losses and optimize partner services
- Maintain and scale contracts depending on success of partner in EEC

Decision Points

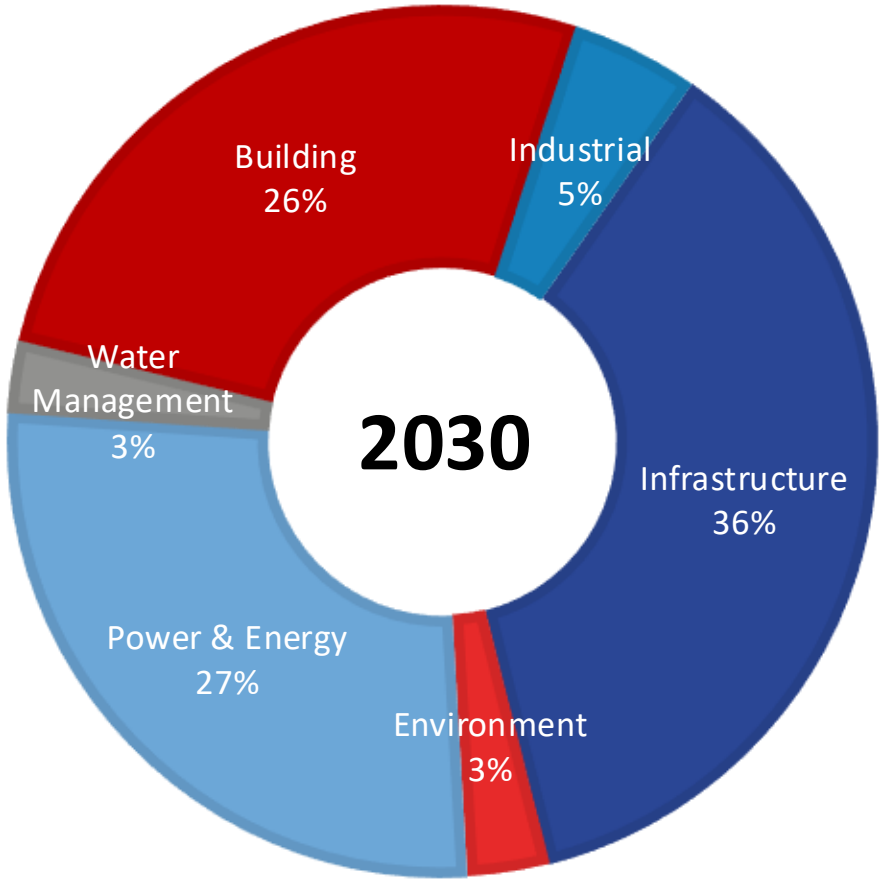

Post-acquisition, Stecon must consider expansion of these contracts depending on operational success by subsidiary

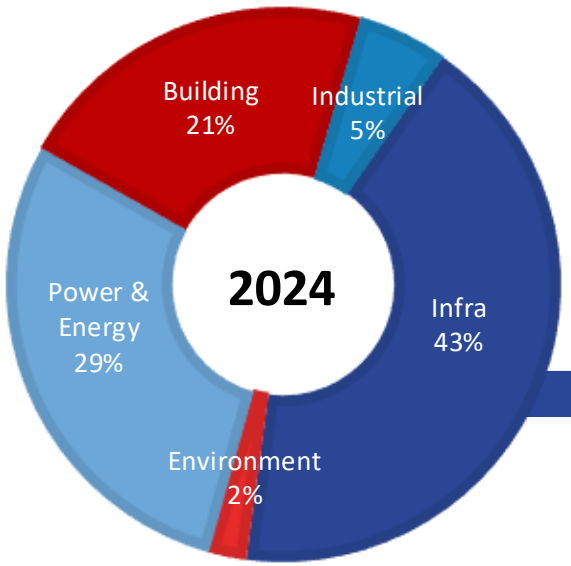

Stecon can achieve Mission 2020's 45B Baht revenue goal through this new acquisition strategy

Strategic Objective Expanding ownership across water managers allows Stecon to achieve a diversified industry portfolio

How does Stecon benefit from this?

1. Stecon becomes the **natural best choice** for future EEC construction projects when an acquired subsidiary is the contracted operator
2. Expansion not only allows Stecon to diversify current company operations through increased water management, but expands Stecon's core portfolio into water systems
3. Stecon is able to achieve occurring revenue outside the one-time construction payment at the beginning of a new contract

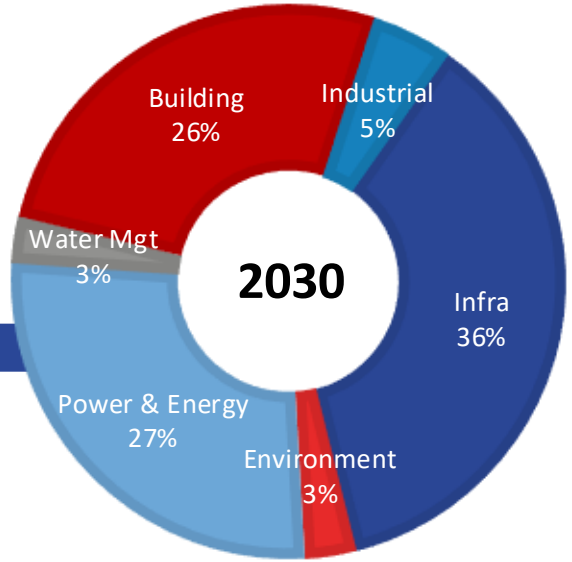

01 Fuel

How can STECON strengthen its core by shifting incremental growth toward higher-value data-center construction?

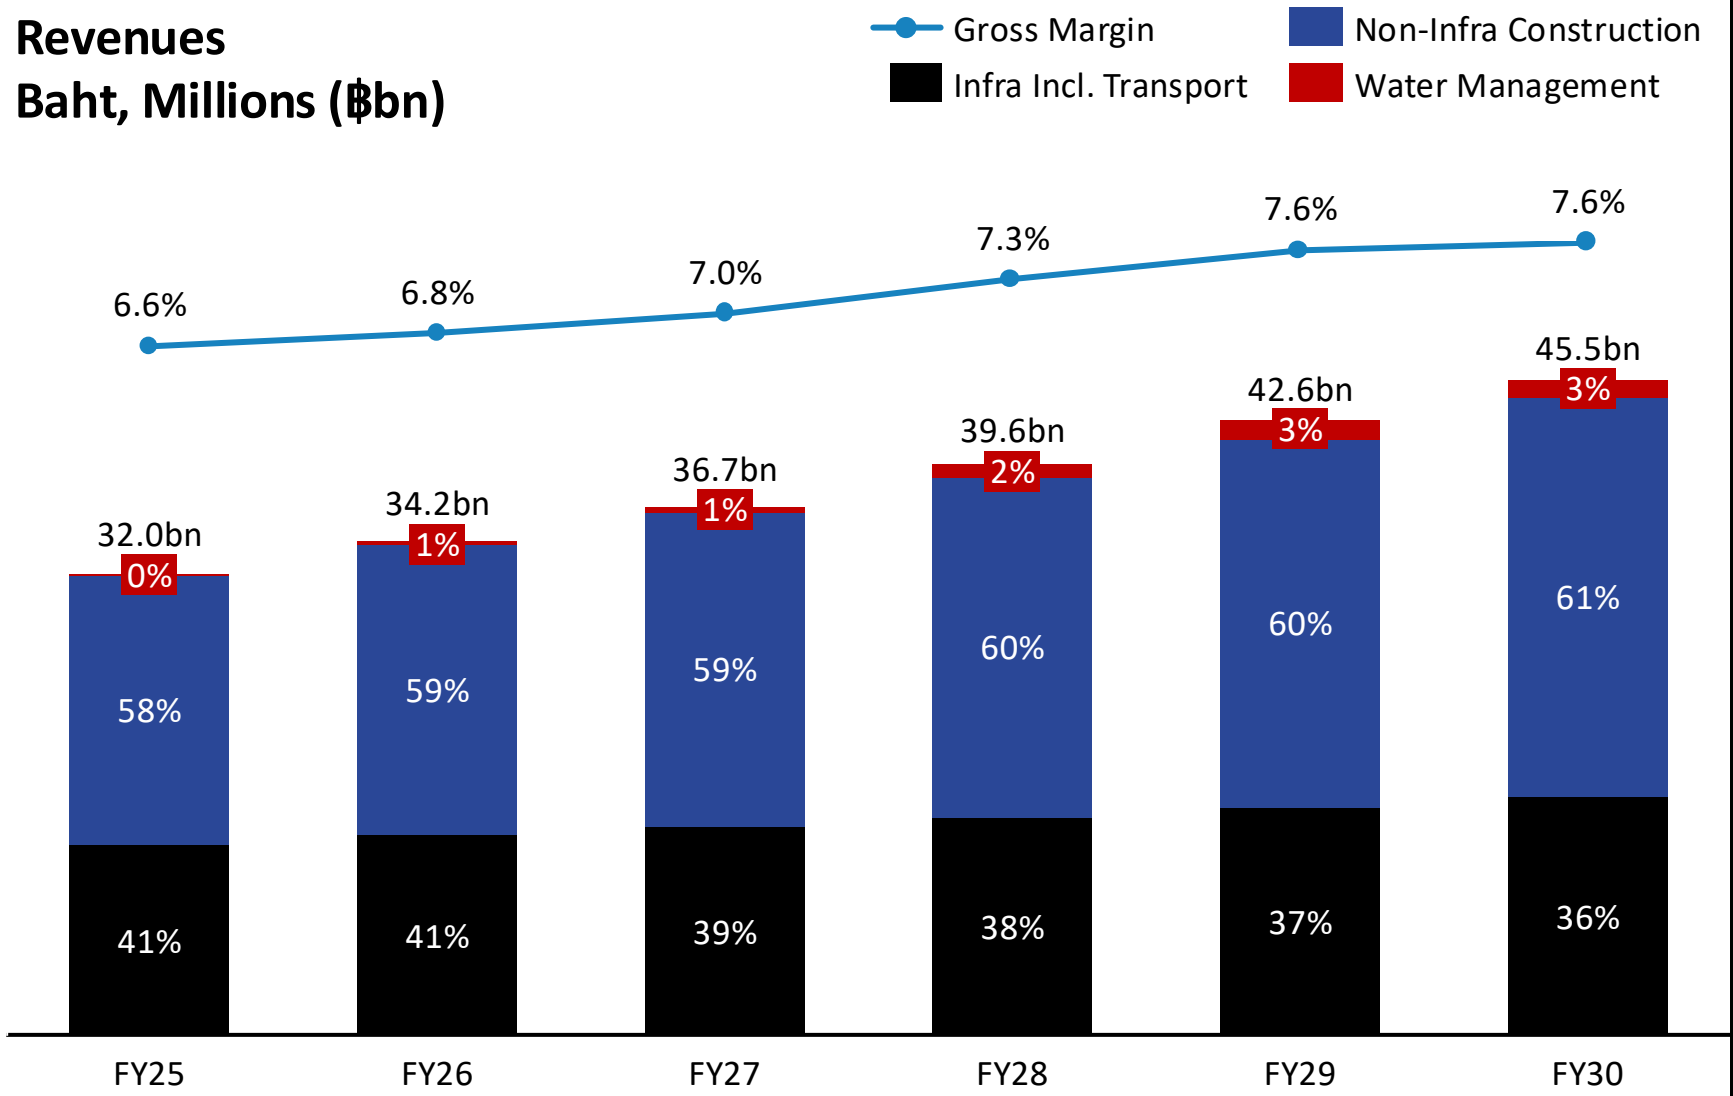

02 Ignite

How can STECON build a new recurring growth engine by scaling water management?

STECON is expected to generate THB 230bn over the next six years, reaching THB 45.5bn in 2030 at 7.6% gross margin

Revenues
Baht, Millions (฿bn)

Key Data Points

Infrastructure revenues grow at market rate of 4.5% CAGR

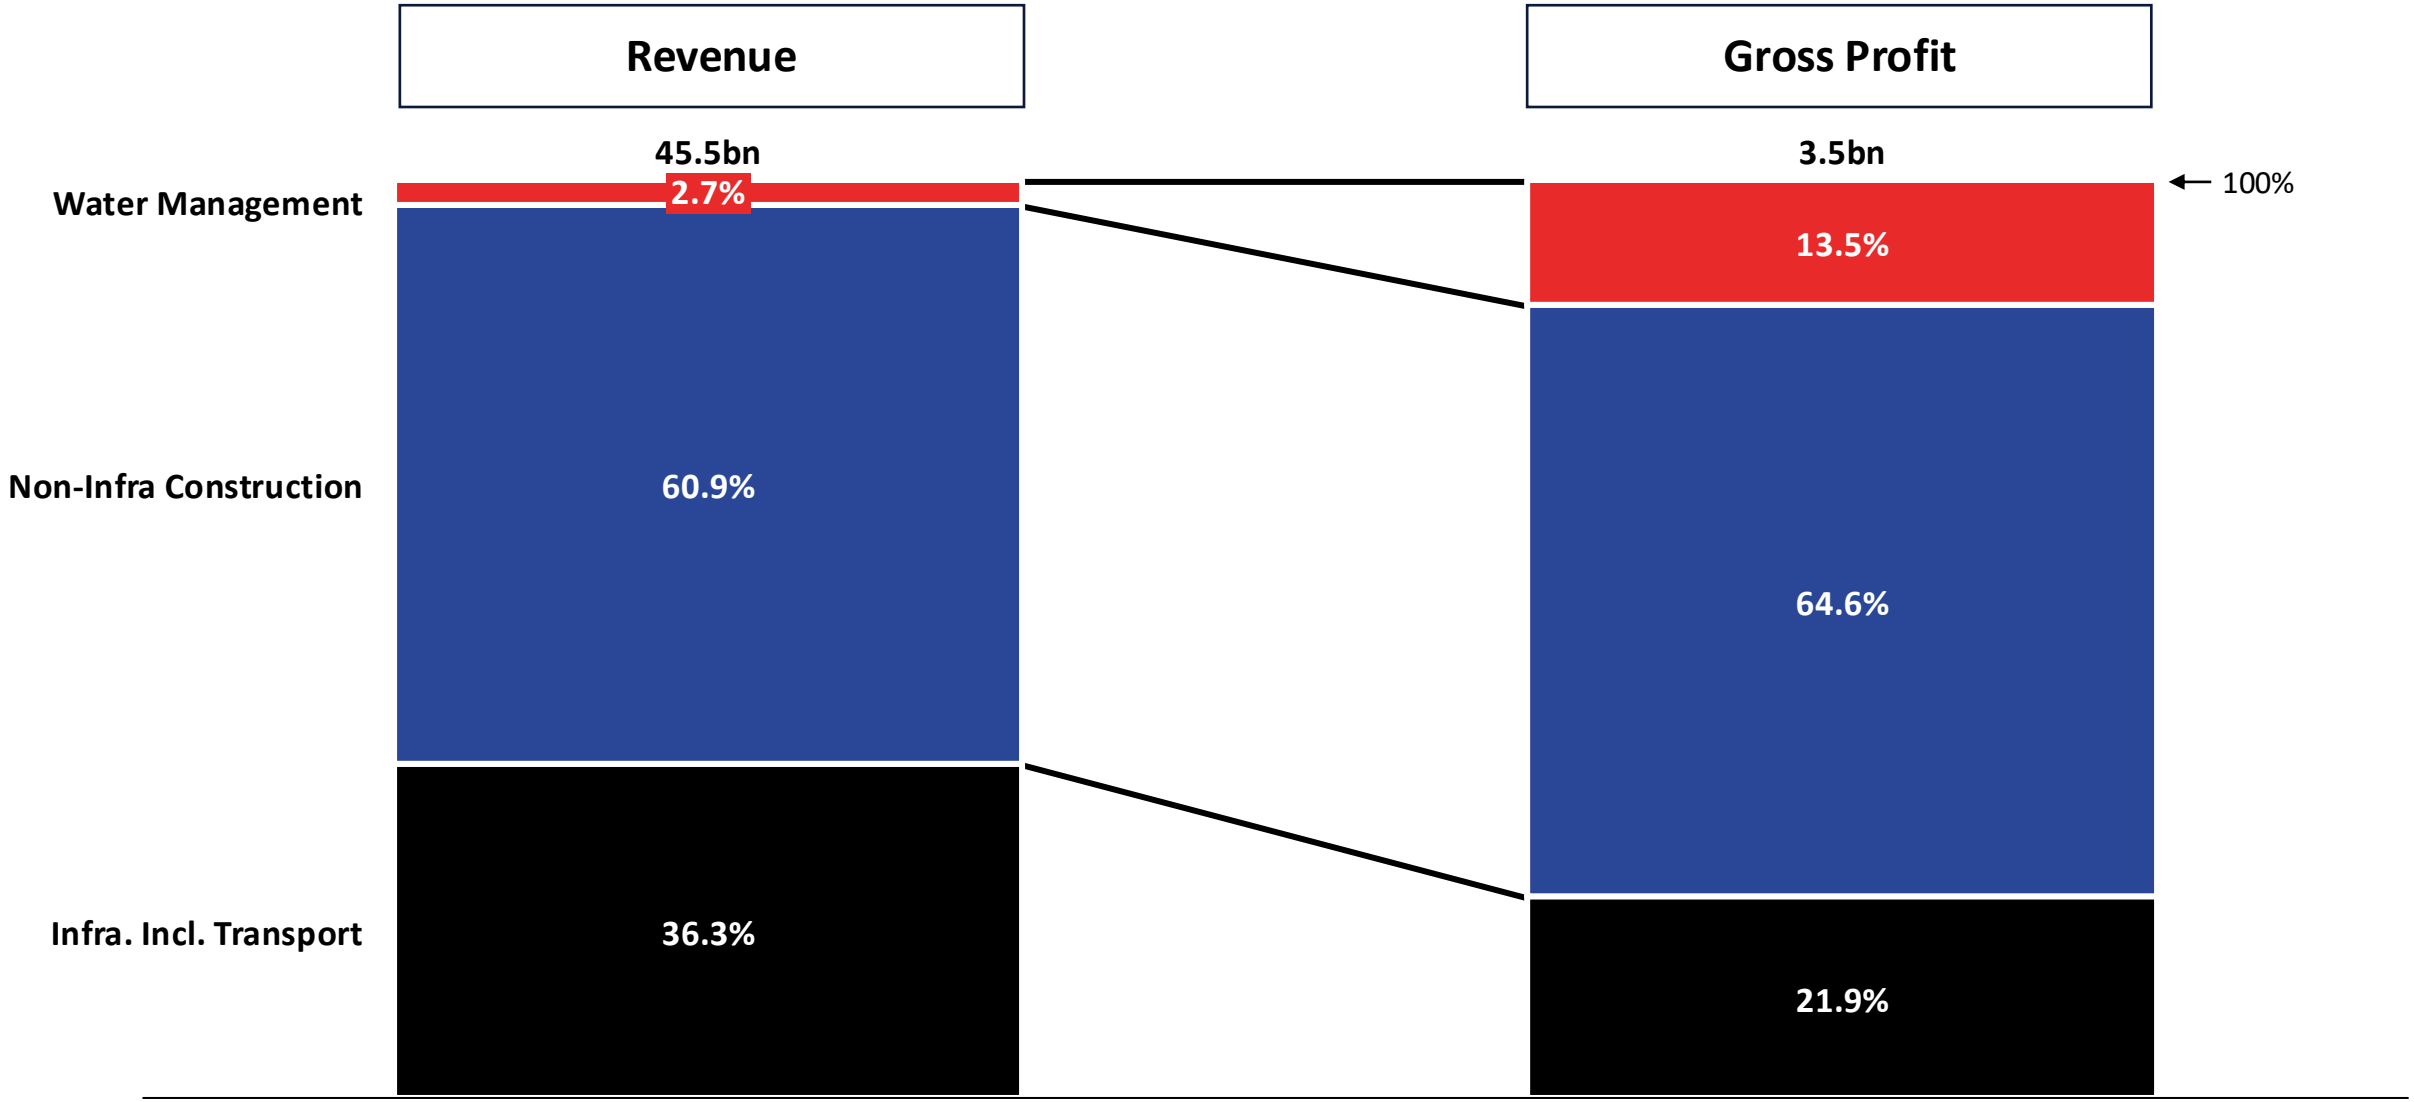

Non-Infra construction growth reflects above market growth (8.3% CAGR) under "Fuel"

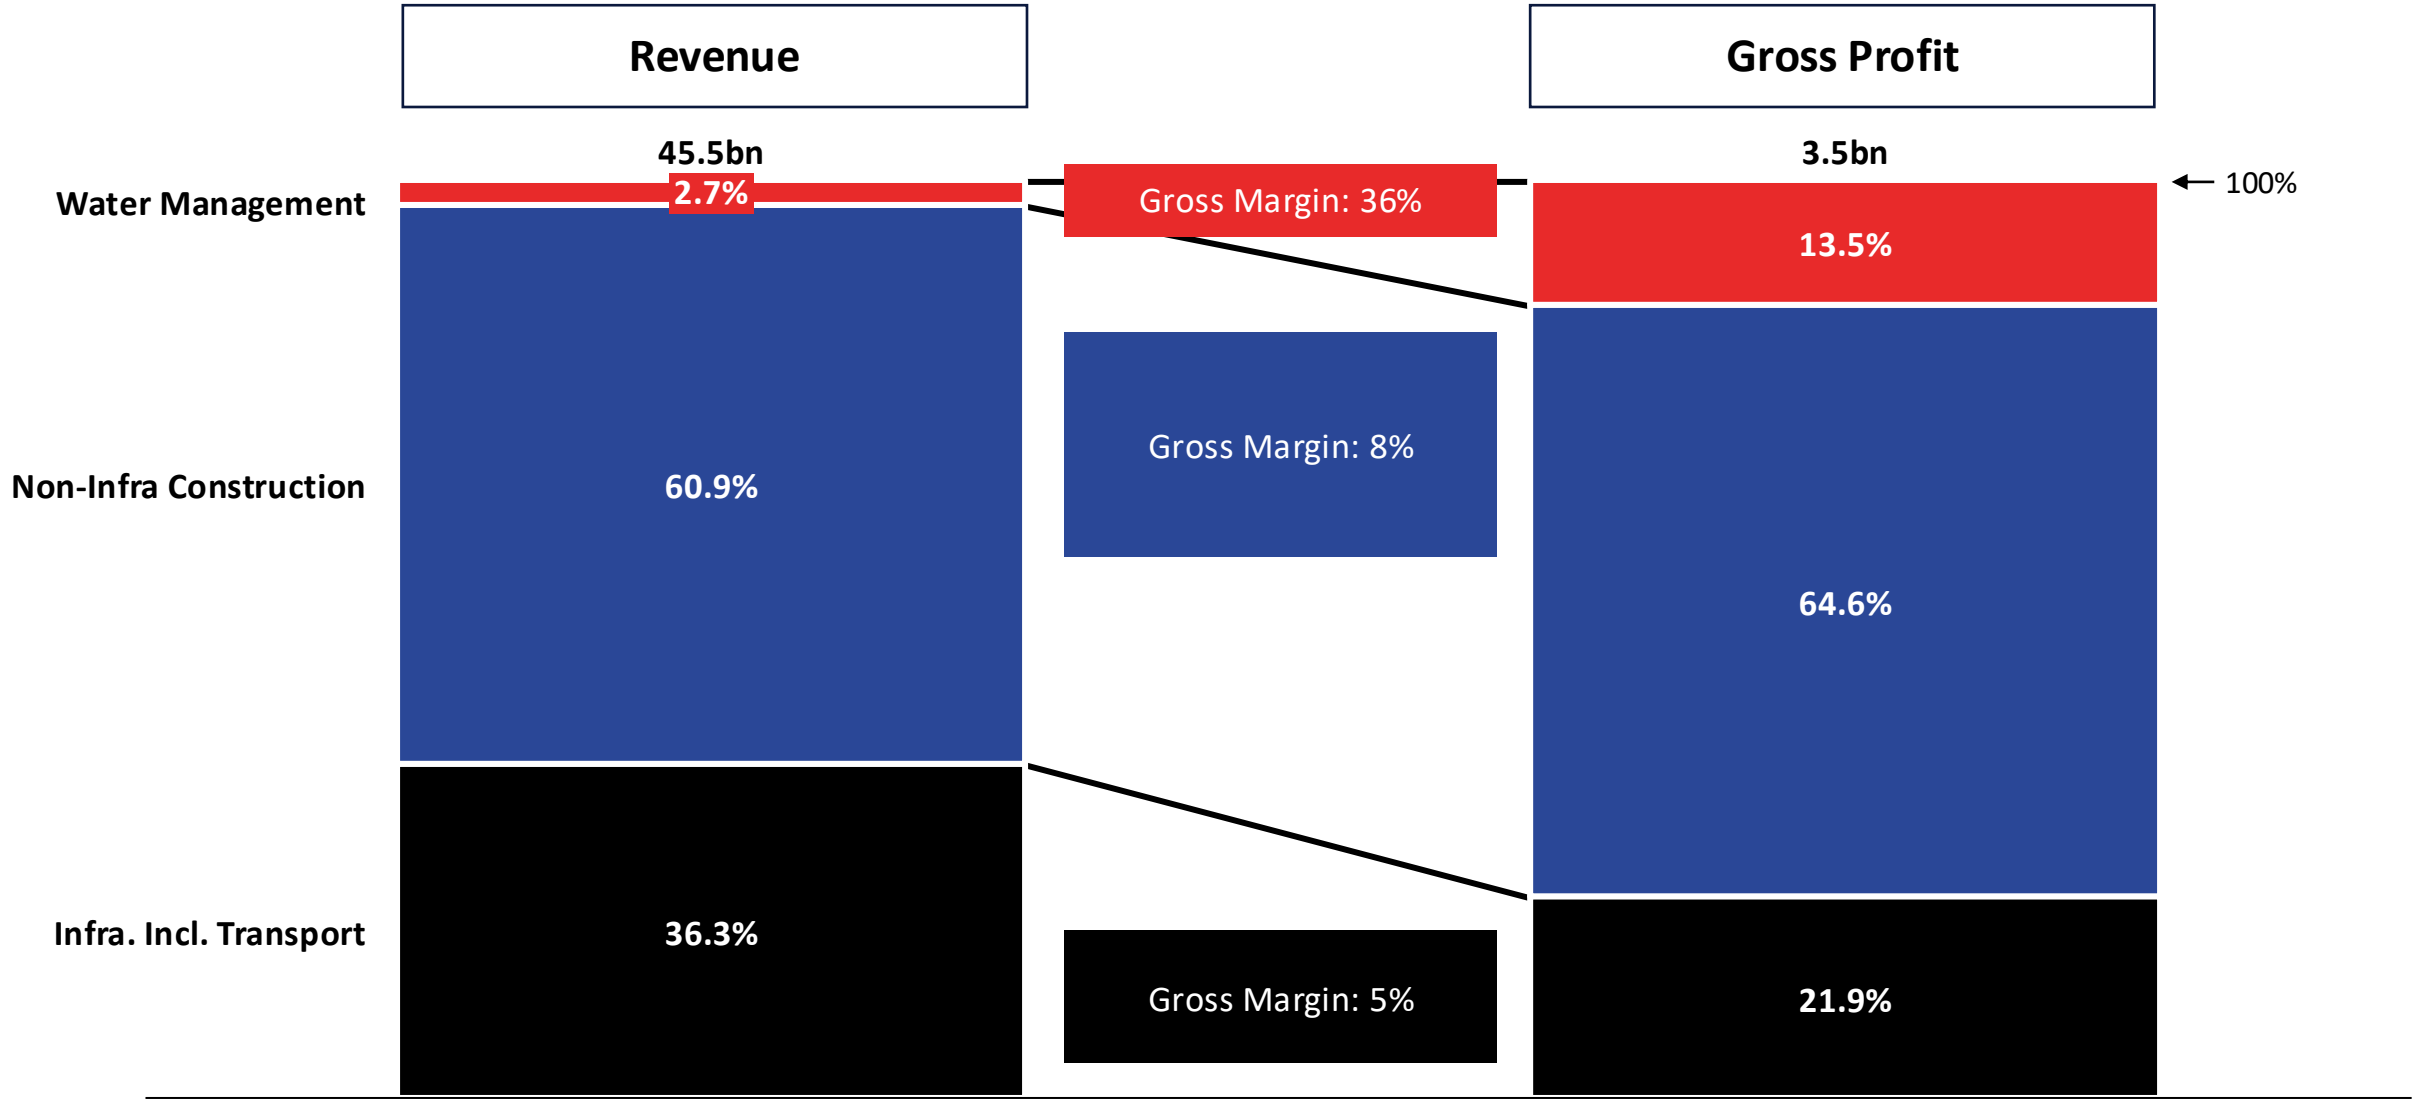

Infra projects: 4.5% GM vs. 8.0% for non-infra.

Gross profit exposure to infrastructure declines, while higher-margin water management revenues grow

Gross profit exposure to infrastructure declines, while higher-margin water management revenues grow

A model facility at 20,000 m³ of water per day facility would generate THB 103m in annual revenue for STECON

	Per Facility / Contract	Per M^3 water per day[1]
Size of facility	20,000 M^3 of water supply per day	
To acquire contract	179m THB	
To construct facility	250m THB	
Revenue per facility	103m THB	

Note: [1] Estimates are based on a comparable analysis against the Mars project

Illustrative estimates are based on the Mars Water Supply deal for the Bangpoo, Lat Krabang, and Nakhon Luang facilities

	Per Facility / Contract	Per M^3 water per day[1]
Size of facility	20,000 M^3 of water supply per day	N/A
To acquire contract	179m THB	8,974 THB
To construct facility	250m THB	12,500 THB
Revenue per facility	103m THB	5,128 THB

Note: [1] Estimates are based on a comparable analysis against the Mars project

Gross margins are benchmarked against established Thai utility operators and adjusted for depreciation and amortization

	Per Facility / Contract	Per M^3 water per day[1]
Size of facility	20,000 M^3 of water supply per day	N/A
To acquire contract	179m THB	8,974 THB
To construct facility	250m THB	12,500 THB
Revenue per facility	103m THB	5,128 THB

Cash Gross Margin: 55%

Gross Margin: 36%

Net Margin: 25%

Note: [1] Estimates are based on a comparable analysis against the Mars project

STECON can expect to achieve a blended net profit margin of 5.33% across its construction and water management activities

SG&A as a % of Revenue

A1: Strat 2 Matrix Grading Criteria

Market Growth	5 = >15% expected growth; 4 = 10–15%; 3 = 5–10%; 2 = 0–5%; 1 = declining
Demand Visibility	5 = structural/essential demand with quantified shortage or committed pipeline; 4 = strong contracted/policy-backed demand; 3 = cyclical but growing; 2 = volatile; 1 = weak
Revenue Durability	5 = ≥15-year recurring contracts; 4 = 10–15 years; 3 = 5–10 years; 2 = <5 years; 1 = mainly one-off
STECON Right to Win	1 point each for: existing platform, active projects, EPC capability, O&M capability, cross-business synergy
Scale-Up Feasibility	5 = existing platform/JV + limited new capability; 4 = modest new capex/partners; 3 = moderate build-out; 2 = major new capabilities/capital; 1 = transformational investment

Source: McKinsey (shoutout Noah & Kacie)

A2: More on STECON

Risk-adjusted Margin

Why 5%? STECON's realized construction gross margin was approximately 4.2%–4.9% from 2020–2023. A 5% risk-adjusted floor requires new projects to perform above that historical range after expected risks. A 7% initial bid target leaves room for risks before reaching the floor.

- Normal bid margin only compares expected contract revenue against expected direct costs
- Risk-adjusted margin also subtracts the expected cost of identified risks

Working Capital Requirement

A profitable project can still consume too much cash. STECON should forecast monthly

Payment Certainty

STECON's 2024 collection period was 39 days, so a **45-day ceiling** is reasonable benchmark.

- Number of days between certification and payment
- Frequency of milestone payments
- Advance payment for mobilization
- Retention withheld until completion
- Financial strength of the customer
- Parent-company or bank guarantees
- History of disputed change orders

Execution Risk

Maximum delay damages and allocation of customer-controlled risks. 10% benchmarked to World Bank documents

- Fixed price before critical designs are sufficiently developed
- Uncapped delay damages
- STECON responsible for delays caused by customer-procured equipment
- No protection against material-price or foreign-exchange movements
- Unconfirmed specialist MEP or cooling capacity
- Aggressive schedule without sufficient float
- Unclear testing and acceptance responsibility

A3: Data Center Customers

Customer segment	Pipeline	Repeatability	Capability fit	Commercial position	Access	Preliminary priority
Global colocation and hyperscale operators/developers	High	Very high	High	Medium-high	High	**Primary**
Cloud hyperscalers directly	Very high	High	High	Medium-low	Medium	**Selective flagship pursuits**
Financial or real-estate developers	Medium-high	Medium	High	Medium	Medium	Secondary
Thai telecoms and individual enterprises	Medium	Medium-low	High	Medium	High	Opportunistic

A4: DPR Case Study

Primary benchmark: DPR Construction

DPR is a general contractor with a dedicated mission-critical business. Its model closely resembles what we are proposing for STECON:

- Early preconstruction involvement
- Permanent mechanical, electrical and controls expertise
- BIM and virtual construction
- Prefabrication and standardized work packages
- Construction quality control
- Commissioning readiness
- Technical teams that transfer knowledge between projects

Impact

- DPR reports 2,716 mission-critical projects completed since its founding.
- Mission-critical work represented 31% of company revenue in 2024.
- 96% of its mission-critical work over the previous five years came from repeat customers.
- Its teams engage early through preconstruction and maintain mechanical, electrical and controls expertise through commissioning. DPR mission-critical construction

Regional benchmark: Gammon and Global Switch Singapore

For Global Switch's Woodlands data center in Singapore, Gammon served as the design-and-construction contractor on a six-story facility containing ten data suites.

The delivery model included:

- BIM across design development and construction
- Off-site assembly of more than 60% of MEP work
- Off-site precasting of more than 70% of the structure
- Coordination of modular MEP systems before site installation
- Design for operation and maintenance requirements

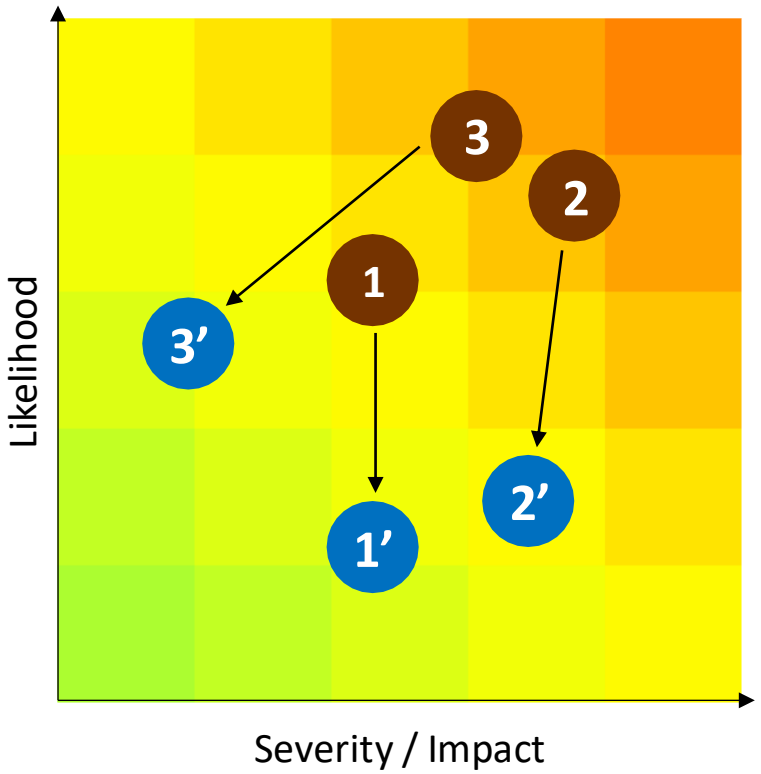

DPR separately supported the owner with BIM and virtual-design management, including:

- Translating Global Switch's requirements into the contractor-selection process
- Establishing BIM execution requirements
- Monitoring model development
- Managing design information through an operations-ready as-built model

This is useful because it shows that the owner, contractor and technical advisers can retain distinct responsibilities while still working through one integrated delivery system. DPR's Global Switch Singapore case

A6: Risks & Mitigation

RISK Matrix

RISKS

1. **Inability to win sufficient data-center contracts to justify capability build-out**
2. **Capital risk from scaling water investments too quickly**
3. **Portfolio concentration in data centers and water increases exposure if either market underperforms**

MITIGATION

1’ Hone the core delivery playbook and pursue multiple operators and campuses; a broad, growing project pipeline reduces dependence on any single contract win

2’ Scale incrementally, using MARS as the proof point; individual investments remain manageable relative to STECON’s overall scale

3’ Maintain STECON’s diversified core construction base and large existing backlog while new verticals scale gradually
