Agenda

Phase II Overview

Marketing

Innovative Solutions

Event Influx Preparation

Risks and Mitigation

Implementation

Appendix

TCG developed a three-pronged approach to Phase II of research

Our Objectives for Phase II

1. Identify areas of improvement for LAMP and understand how to implement the changes prior to launch and LA28
2. Develop a comprehensive plan for LAWA to prepare for the launch of LAMP through different marketing channels
3. Explore innovative partnerships to further assist passengers with disabilities throughout their passenger journey
4. Create and segment different strategies to handle large influxes of passengers due to upcoming events
5. Understand how to effectively implement strategies while considering the various risks associated

Implementation of Phase II

Conduct Insightful Research on LAMP Project

- **Infrastructure:** Continue exploring APM infrastructure to optimize ADA features before completions
- **Demand:** Understand what demand may look like based on case studies of past Olympics
- **Event Influx:** Segment short term vs. long term methods to cater to influxes of LA28 and World Cup

Solidify Messaging and Marketing Tactics

- **Marketing Channels:** Discover the most effective channels, like social media, website, and in-person
- **Streamlined Messaging:** Understand how to effectively communicate APM pathway
- **Global Audience:** Ensure the messaging systems will reach the global audience effectively

Identify Key Methods to Track Future Success

- **Data Collection:** Identify the most efficient way to go about collecting necessary data for analysis
- **Implementation:** Identify and address key risks of the different strategies and prioritize certain aspects to be implemented first
- **Metrics:** Develop key metrics to benchmark future success on

TCG's three-pronged approach will ensure comprehensive insight to prepare LAWA for the launch of LAMP and event influxes with an emphasis on accessibility.

Digital Marketing Strategies

Digital marketing strategies can build anticipation and awareness of LAMP among travelers with disabilities

Digital Marketing Strategies

	LAX Website	Travel Bloggers	Social Media Outreach
Strategy	• Launch a centralized page with APM details by disability type • Integrate assistive tools like screen readers, text resizing, and multi-language support	• Partner with creators like WheelchairTravel.org and LA-based disability bloggers • Share authentic articles demonstrating APM usage	• Post to LAX Instagram account • Launch short-form videos showing real travelers with disabilities using the APM with captions and voiceover
Rationale	• Centralized content gives travelers independence and reduces confusion at LAMP • Tools like MCO's assistive toolbar proved highly used and cost-effective to implement	• Content from lived experience from a disabled perspective builds greater credibility • Provides organic reach through niche, but active existing disability communities	• Social media reaches travelers where they already engage as LAX has >200K followers • Representation online signals inclusion with disabled and neurodivergent communities
KPIs	• Track pageview and time-on-page for accessibility resources post-launch • Watch for an increase in positive reviews or reduced ADA-related inquiry emails	• Engagement rate (e.g., shares, comments, pageviews) on influencers' content • Review feedback from the content creators' themselves to gain further perspectives	• Track impressions, shares, and engagement on LAMP and disabled focused content • Observe which social media platforms have the greatest engagement and post there

Informative posts across LAX social media platforms and collaborating with disability content creators gives disabled travelers key information about LAMP ahead of launch.

Customized platform strategies and accessible content design allow LAX to connect with disabled audiences online

Content for Social Media Platforms

Instagram

- Use carousel posts for tips by disability type (e.g., “3 Things to Know for Blind Travelers”)
- Focus content for Gen Z users
- Share short, subtitled Reels demonstrating accessibility features like APM boarding
- Consider making a story highlight for information about LAMP for quick access

Facebook

- Leverage LAX’s >500K followers to communicate to the large 50+ age demographic that uses Facebook at a high rate
- Post updates in local disability-focused Facebook groups (e.g., “Accessible Travel Community”)
- Share event invites for LAMP tours or awareness days in caregiver communities

YouTube

- Upload walkthrough videos of the LAMP experience from different disability perspectives
- YouTube can reach low-vision and Deaf users with accessible, long-form video content
- Use key words in titles to increase visibility with SEO
- Use YouTube Shorts to post short and informative content

Considerations for Accessible Social Media Marketing

- Add descriptive alt text to all images so screen readers can clearly convey visual content to those with impairments
- Caption all videos and consider including full transcripts or detailed audio descriptions when possible
- Use high-contrast visuals, bold colors, and legible font sizes to better support user with visual impairments
- Write in plain, direct, and inclusive language to ensure clarity for neurodivergent and English learning audiences
- Format hashtags in CamelCase (e.g., #AccessibleTravel) so screen readers pronounce them correctly
- Provide links to assistance pages or resources with clear calls to action like “Learn how to board the APM”

Through leveraging disability-focused groups on Facebook and creating informative posts on all platforms, LAX can inform travelers of key components of the LAMP.

By examining the success of past digital accessible marketing initiatives, LAX can gain valuable insight into promoting the LAMP

Tokyo 2020 Paralympics

Background
- Tokyo 2020 launched the #WeThe15 campaign, a global digital movement for disability inclusion, achieving 750M views and 2.5B X impressions

Implications
- Unified storytelling and influencer amplification drove high levels of online reach for accessibility
- Offers LAX a model to position LAMP as a milestone in accessible travel ahead of LA28
- LAX can similarly use hashtag to promote content

Principality Stadium

Background
- In 2023, Principality Stadium launched an Accessible Fan Guide digital platform, offering navigation support with disability friendly features

Implications
- A similar initiative could be marketed to position LAX as a leader in accessible airport travel
- Demonstrates how digital tools can reduce anxiety for disabled travelers by offering support as it can give a walkthrough of the new LAMP layout

Strategies for Online Marketing

Storytelling Tactics

- Launch a #AccessLAX social media campaign to build visibility and momentum ahead of LA28
- Share social media reels spotlighting travelers using accessibility features in real-time upon availability
- Collaborate with disability influencers to co-create videos showing LAMP's inclusive features

Technological Tools

- Develop an "Accessibility Journey Builder" app to personalize trip planning at all LAX facilities
- Partner with disability-focused media to distribute launch stories and web-friendly disability guides
- Publish updates via an online accessibility dashboard tracking progress and features

Showcasing disabled travelers using LAMP through social media campaigns and launching a personalized accessibility trip planner can establish LAX as a digital leader in inclusive travel.

Inclusive media campaigns build trust and showcase accessibility for disabled travelers

SEA Access Campaign

Background

- SEA launched a press campaign regarding their new “SEA Access” initiative
- A video showcased services was co-developed with disability advocates to display the results

Implications

- Builds credibility through visibly incorporating feedback from the disability community
- Promotes early awareness and excitement

Inclusive Media Tactics

- Host a press event with ASL interpreters, captioning, and a wheelchair-accessible stage setup
- Invite disability-focused media alongside traditional press outlets for a more representative coverage
- Feature speakers from disability advisory boards and local community leaders in launch events
- Partner with local disability nonprofits to distribute announcements through trusted channels
- Share accessible digital press kits with plain-language descriptions and images with descriptions

Marketing Launch Timeline

Pre-Launch	Soft Launch	Launch	Post-Launch
• Gather feedback from disability groups • Update website with accessibility content • Coordinate with community partners	• Offer free trial rides and early previews • Share experiences from ambassadors • Confirm accessible signage placement	• Launch media event with ASL support • Station ambassadors at key entry points • Post updates online and on display systems	• Monitor feedback from disabled travelers • Highlight success stories and milestones • Adjust services based on lived experience

Disability-centered press events and storytelling can elevate visibility while demonstrating LAX’s authentic commitment to inclusion.

Offline Marketing Tactics for LAMP

Proven in-person outreach tactics can position LAMP as an accessible travel option for passengers with disabilities

Best Outreach Channels

- Senior centers and rehab clinics can help reach older adults and those with limited digital access
- Disability expos and mobility fairs offer direct access to engaged communities and advocacy leaders
- Community centers and transit hubs serve as locations to share physical materials, such as pamphlets, as well as live example boarding demos
- Collaboration with local nonprofits enables targeted outreach through already trusted organizations
- In-airport touchpoints like entryways, help desks, and shuttle stops offer high-visibility exposure

MSP Fly Before You Try

Background

- Minneapolis–St. Paul Airport hosts trial runs through TSA, gates, and planes for travelers with disabilities
- Participants include families with autistic children and passengers with mobility or sensory disabilities

Implications

- Helps LAX reduce anxiety by allowing disabled travelers to preview the expanded airport layout
- Enables family members to preview routes themselves and better support disabled travelers

Strategic In-Person Engagement

Disabled Traveler Needs

- Clarify where accessibility help points and service desks are located at each entry and exit
- Share maps or signage that indicate the location of LAX's accessibility office and key resources
- Describe how to transfer between APM and terminal services if using mobility assistance through LAX

Effective Awareness Strategies

- Partnerships with senior centers and disability nonprofits for outreach with potential travelers
- Using of large print fonts, braille, and tactile materials in key high-traffic areas
- Deployment of staff to support navigation
- Potential trial run programs with the community

In-person strategies create trust, reinforce visibility, and ensure that LAMP meets the needs of disabled travelers through proven outreach methods.

To raise internal operational awareness, LAX can utilize a four-step employee marketing plan

Marketing Launch Timeline

Outline

- Visualize and create a LAMP employee packet
- Contains APM operations and role-specific guides
- E.g., How to guide a flyer in terminal 5 to ConRAC

Distribute

- Print packet and place them in common areas
- Send out online PDFs to all employees via email
- Place QR codes around the office for the PDF

Feedback

- Identify FAQ through employee surveys
- Determine success by counting total inquiries
- Identify employee service gaps through customers

Optimize

- Use feedback to identify common misconceptions
- Adjust role-specific LAMP guides if necessary
- Expand into alternate online marketing tactics

Sochi Airport (2014 Olympics)

Background

- Partnered with the Olympic Hospitality Program and volunteers to teach English and provide directions
- Tripled their airports capacity, doubled their staff, and upgraded their security in preparation for the Olympics
- Distributed handbooks for media and press staff with event logistics, terminal access zones, and contacts
- Deployed Olympic-branded signage across airport zones that were consistent with broader ads city-wide

Implications

- Partner with local nonprofits and volunteers to provide language instruction and to provide navigational help
- Increase employee workforce through volunteers and new hires to accommodate for the projected influx
- Create a handbook like Sochi's for LA28 but include the LAMP's services and directions for using the APM
- LAMP visual identity should appear across baggage claim, APM stations, and floor decals in all terminals

LAX can bring awareness to its employees by creating and distributing an employee LAMP handbook to improve and prepare for the launch of the APM.

Visa centers, travel agencies, and airplanes provide additional touchpoints of outreach for LAMP services

International Outreach Methods

US Visa and Passport Centers Abroad

- Create a physical LAMP brochure consisting of APM and disability services with visual guides and layout
- Partner with US embassies, visa processing agencies, and passport centers worldwide to pass brochures out in interviews and waiting rooms
- Translate brochure into the language of the respective country and ship them to centers for free

International Travel Agencies

- Partner with leading travel agencies in high-traffic origin cities (e.g., London, Tokyo, Shanghai)
- Offer co-branded content to incentivize agencies to promote LAX as a travel destination and disclose the LAMP improvements during the booking process
- Educates passengers of LAX services before they arrive, ensuring flexibility, and improved awareness

Raising Awareness Through Airplanes

Engage	Equip	Evaluate	Enhance
• Identify top airlines flying into LAX • Pitch shared value in improving passenger experience through reduced confusion	• Design flyers and seatback cards for APM • Attach a QR code and print in top language • Pass out flyers and cards inside of airplanes	• Utilize QR codes to offer quick customer surveys • Ask airline staff to keep track of common LAMP questions and continue monitoring responses	• Rotate routes, content, or languages based on customer feedback • Update content annually to ensure similarity with online marketing

LAX should partner with airlines, visa centers, and travel agencies to pass out LAMP cards to maximize increase outreach globally.

Prioritizing International Marketing and Digital Platforms for LAMP

Quantifying characteristics of leading countries flying into LAX allow for clear prioritization for marketing efforts

Considerations for Marketing

- Prioritize countries with higher social media engagement rates to optimize budget allocation
- Countries with strong Olympic competitors with a history of winning are more likely to watch live
- Increase impact of disability services by targeting countries with higher proportions of disabilities
- Online marketing strategies must consider the proportion of elders to maximize effectiveness

Leading Airline Routes to LAX

- **London, United Kingdom: :** LAX's busiest global route with >97K seats available each way daily
- **Seoul, South Korea:** >63K flyers a month with ~6 flights a day through Korean and Asiana Airlines
- **Guadalajara, Mexico:** >280 flights a month and ~10 flights daily with Volaris hosting >55% of flights
- **Taipei, Taiwan:** Dominated by China Airlines, EVA Air, and Starlux Airlines, combining to 6 daily flights
- **Vancouver, Canada:** Up to 11 daily flights and >51K seats daily, dominated by Air Canada

Considerations Numerically

Considerations	Leaders
Social network usage rates and proportion of population to users	South Korea with ~93.4% social network penetration
Proportion of population that uses mobile devices regularly	All countries range from ~95% to ~98% except Mexico at 83%
All time total number of medals won in the Summer Olympics	United Kingdom with 285 gold medals and 948 medals in total
Disability prevalence in target countries by proportion of disabilities	Canada with ~22% of the population with at least one disability
Proportion of a countries population that is aged >65 years old	All countries range from 18-20% aside from Mexico at ~8%

LAX should prioritize their marketing strategy to target the United Kingdom, South Korea, and Canada to reach the largest demographic of travelers coming to LAX for LA28.

Statistica, TTW, UK Parliament

Targeting marketing efforts toward platforms unique to each country offers additional outreach and awareness

Social Media Platforms and Marketing Examples

Naver

- Viewed as the search engine for South Korea, holding 48% market share compared to Google's ~44%
- Also serves as a blogging platform with ~3M active monthly users
- Offers short videos and a forum to promote travel and new products

Visit Maldives

- Led a 7-month digital marketing campaign to promote the Maldives
- Posted weekly blogs, using customized ads and keywords

Implications

- Leverage Naver's travel blog style platform to showcase the APM
- Identify top performing content creators and increase LAMP outreach through paid partnerships

KakaoTalk

- Primarily used in South Korea as a messaging app with >48M active users for ~85% of the population
- Kakao Channel is comparable to Facebook, offering space for ads
- Message ads are $0.01 a message and full-screen ads ~$36K per day

AmorePacific

- Utilized customer preference history to find potential buyers
- Sent SMS messages through KaKao Talk to advertise services

Implications

- Message passengers who recently bought plane tickets to LAX
- Identify flyers who requested disability services while purchasing ticket and market to them

WeChat

- 1.3B monthly active users globally
- WeChat official accounts costs $99 USD and are required to post ads
- ~$22 for picture ads and ~$26 for videos per thousand impressions
- Minimum WeChat marketing cost for marketing in Asia is ~$7.3K

Caesars Entertainment

- Created a QR code with WeChat to control hotel room features
- Since 2014, WeChat has enabled users to connect with hardware

Implications

- Create a QR code through WeChat for LAMP services and APM info
- Leverage WeChat and partner with navigational startups to provide airport guidance through WeChat

LAWA can maximize outreach for APM services by delegating their efforts toward travelers from Asia through platforms unique to their country.

TROJAN CONSULTING GROUP

Agenda

Phase II Overview

Marketing

Innovative Solutions

Event Influx Preparation

Risks and Mitigation

Implementation

Appendix

Innovative Partnerships

LAWA can leverage existing partnership with Future Travel Experience (FTE) to gain valuable aviation solutions

FTE Opportunities

- LAWA is one of the >50 corporate partners of the FTE Digital, Innovation & Startup Hub, a global aviation community
  - FTE covers and has insight into all of its cooperate partners, thus can be used to identify other airports' successes
- Corporate partners have access to monthly meetings and hundreds of startups with aviation-specific solutions
- LAWA must leverage its partnership by identifying effective, cost-efficient start-ups, especially during the FTE World Innovation Summit on May 13-15 hosted by PIT, an airport that tested many autonomy-enabling technologies

Two FTE Corporate Partners Incorporate Be My Eyes

App Background

- Be My Eyes is a universal app that connects blind or low-vision users with sighted volunteers through live video calls
- Users can also take pictures and have Be My AI describe them
- Est. 2015, app now has ~811K users with >8.6M volunteers
- Provides free and unlimited calls available in >150 countries

Current Use

- Aeroporti di Roma (ADR), a FTE partner, worked with Be My Eyes
- Allows passengers to gain free, instant help during travel
- Emirates is soon to be the first airline integrated into the app
  - Emirates leverages app's low-vision–friendly design to connect passengers directly with agents, not volunteers

LAX Application

- LAX can promote the use of Be My Eyes for challenges before, during, and after travel
- Passengers can get help booking tickets, navigating airport, and reaching ground transportation
- Similar incorporation into the app will allow blind and low-vision passengers to contact LAX customer service directly

LAWA should strengthen its partnership with FTE to identify accessibility solutions being implemented into other airports, such as Be My Eyes.

LAX should look into wayfinding solutions for passengers that experience total blindness to improve autonomy

NaviLens App Background

- NaviLens is a wayfinding app that audio guides visually impaired users through high-distance QR-like codes
- Users hold their phone to their chest until the app detects a code which will then provide directions to the next code
- Can scan these custom tags from 15 meters (~50 feet) away, 12x farther than standard QR codes or barcodes
- Offers wide-angle scanning up to 160º, making tag detection easier without the need for precise alignment
- By detecting user's exact position and angle relative to tag, it gives precise directions that feel like personal guidance

NaviLens at MTA New York City Transit

Background

- Uses >100 NaviLens codes, guiding all users indoors through augmented reality virtual arrows
- NaviLens App provides wayfinding assistance
- NaviLens GO App aids sighted viewers as well, providing in-station navigation, real-time train arrival information, and service status information

Implications

- NaviLens codes are noticeable and easy to use in travel, helping all passengers in 34 languages
- While NaviLens has not been implemented into airports, it has the technology to provide wayfinding coverage in extensive metro systems

LAX Adoption

- Will aid multiple groups of travelers through app's setting options such as sign language, "show accessible route," "automatically start TTS locution when available," and font size options
- NaviLens codes must be put up around airport and drop-off points, but can be placed out of the way
- Codes must be placed throughout a passenger's journey, even if codes simply say to keep going
- The bright codes will benefit visually impaired LAX travelers, while easy scannability aids blind travelers
- First 10 NaviLens codes generated for free online
- Choose size and text desired text to be read aloud
- Like NaviLens GO's live updates on MTA arrivals, show live APM, arrival, and departure updates

LAX should consider using NaviLens as a tool to assist both blind passengers with independent navigation and sighted passengers with real-time APM and flight updates.

LAX can explore wayfinding technologies that require no physical in-airport installations

GoodMaps App Functions

- Indoor navigation app that works with multiple transportation systems, offering users a variety of routes to destination
- Verbal and visual directions for paths including step-free paths for passengers with mobility impairments, routes with fewer obstacles for those with visual impairments and quieter routes for those uncomfortable with crowds

GoodMaps at SDF and PDX

Background

- SDF: LiDAR scan took 4 hours without any interruptions to airport operations or service
  - Digital map creation took 2 weeks
  - Map includes >300K square feet
- PDX: Has 373 named destinations to direct to

Implications

- LAX like these airports can choose GoodMaps for a solution that has no intrusive hardware to maintain
- After initial trials, app's benefits are evident, as PDX expanded availability to a wider audience
- Total area of passenger terminals in LAX is ~3.8M square feet, so timeline will not reflect that of SDF
- There have been >150 completed uses every month

Installment Process

Scan: GoodMaps technician do walk throughs using a handheld LiDAR scanner to takes 360º imagery

- Requires 1-2 scans per floor, a very non-invasive process, allowing airport operations to continue

Map: Scan is developed into a digital representation

- Digital twin map of each level of building created, with names and all destinations

Route: Hundreds of accurate routes created

- Can be accessed through the app or, to increase use, through QR codes that direct to the web

While GoodMaps can benefit all passengers, LAX should first pilot the app to determine largescale implementation feasibility.

Agenda

Phase II Overview

Marketing

Innovative Solutions

Event Influx Preparation

Risks and Mitigation

Implementation

Appendix

Olympics Flow Management

LAX should have a two-layered solution to restoring operational flow quickly to minimize disruption and traveler experience

- Crowded spaces block clear paths, making it difficult for travelers with mobility disabilities to navigate safely
- Chaotic and noisy environments can cause significant mental fatigue, especially for those with cognitive disabilities

Improving Foot Traffic

Staffing

- Utilize dashboard and kiosks to determine areas where high foot traffic is causing dissatisfaction
- Maintain a pool of cross-trained and on-call volunteer staff that can be reassigned to bottleneck areas, enabling a more flexible and scalable workforce

Flow Management

- Use barriers, lane dividers, and passenger segmentation to streamline movement in queues
- Priority triage lines serve passengers with disabilities, elderly travelers, families with young children, and those at risk of missing imminent departures

Additional Infrastructure

- Open additional ADA-compliant waiting zones with freestanding partitions and folding chairs, ensuring clear paths to exits
- Leverage airport buggies for travelers with disabilities to avoid bottlenecks, reduce congestion, and ease navigation

Improving Travel Experience

- In cases where foot traffic cannot be improved, LAX can use additional amenities to minimize traveler dissatisfaction
- Offer accessible water refill and device charging stations near long lines at security and elevators
- SFO enhanced passenger amenities (lounges, yoga rooms, or art) to offset travelers' frustration with long queues
- Keep passengers informed about wait times and alternative routes via mobile apps, signages or digital displays

LAX can improve operational flow through staffing and added infrastructure, while traveler amenities help offset negative travel experiences.

Previous Olympic city airports utilized various intensive training methods to promote inclusivity

Justification and Methods for Disability Staff Training

Projected Influx

- Newly hired staff require training for the 5M projected assists by 2028 for the FIFA World Cup and LA28
- Paris required a 5x increase in wheelchair accessible transportation when they hosted the Olympics
- The Paralympics forecast an expected >4K total in daily wheelchair users coming in and out of LAX
- Galeão Airport saw a ~125% increase in passengers a day from Rio 2016 and successfully prepared for this influx through intensive and delegated training

Prioritizing Training and Content

- **Frontline agents:** Focus on sensory-friendly communication, handling assistive devices, and location-based guidance for the visually impaired
- **Vendors:** Mandate online disability courses and ensure disability friendly infrastructure with the ODO
- **Temporary staff:** Streamline onboarding of workers for LA28 through online accessible training modules
- **Security staff:** Ensure non-discriminatory screening and de-escalating neurodivergent passengers

Training Methods

Simulations

- Role-playing modules to replicate disability needs to improve confidence of staff

Cheat-Sheets

- Compile a list of FAQs and the answers for new staff to memorize

Online Platform

- Standardize an online training platform to improve onboarding of new staff

Shadowing

- Reach out to previous Olympic airport cities and receive live training mentorship

To best prepare for LA28, prioritizing additional training platforms will best improve the experience of passengers with disabilities.

TSA, Wheelchair Travel

Learning from Other Airports

Feedback and takeaways from past Olympics airport hosts can show LAX areas to improve upon

Pain Points of Other Airports

	Isolation	Long Wait Times	Shortsighted Planning
Example	• Haneda offered services that isolate disabled passengers (e.g., separate walkways) • Focused on distinguishing those who require assistance	• Paralympic athletes reported long wait times for receiving assistance at Heathrow • Staff was often delayed given demand underestimation	• Past Olympics hosts have invested in temporary resources to meet demand • This includes renting increased ramps, wheelchairs, etc.
Feedback	• Disabled passengers have felt uncomfortable and even dehumanized within the airport • Passengers with disabilities may not wish to receive special treatment and stand out	• Added to the stress of these passengers, specifically Paralympic passengers who had events to prepare for • Contributed to overall airport congestion at peak demand	• There is no long-term benefit to hosting the Paralympics for future disabled passengers • Airport accessibility services worsen once again following the end of the Olympics
Solution	• Increase passenger comfort without separate procedures • E.g., focus on initiatives involving accessible infrastructure and staff training rather than separate walkways	• LAX should increase staff on standby in case of unexpected demand surges during LA28 • Implement infrastructure that reduces congestion (e.g., tactile paving, digital signage)	• Invest in services that can be maintained beyond the Olympics (e.g., staff training, permanent infrastructure) • Allow LAX to stay prepared for future demand surges

LAX must focus on simultaneously fostering inclusivity and shorter wait times, while focusing on long term benefits, such as staff training and permanent infrastructure changes.

Disability News Service, Euronews

LAX can learn from the charity partnership utilized by the London Heathrow Airport in preparation for hosting the 2012 Olympics

Charity Partnership

- Ahead of the 2012 Olympics and Paralympics, London Heathrow partnered with the mobility charity Whizz-Kidz
- Using the British Airports Authority's £20M investment, Whizz-Kidz, building upon their past accessibility work with UK transportation hubs, ensured disabled passengers had accessible facilities during peak Olympic demand

Staff Training

- Whizz-Kidz offered expert training to staff and volunteers
- This included disability awareness and mobility equipment handling training
- Staff training has benefitted Heathrow beyond the Olympics to meet future disability needs

Resource Allocation

- They helped prioritize resources
- 12 ambilifts were installed, helping mobility impaired passengers exit and enter the aircraft with more efficiency
- Accessible toilets were added, as well as 100 news ramps to help with loading wheelchairs

Feedback

- Whizz-Kids also provided first-hand, expert feedback on accessibility services
- They identified pain points such as transportation gaps and inconsistent airport signage
- Heathrow saved money through utilizing a charity partnership

LAX Implementation

- LAX can work with an LA-based disability awareness charity (e.g., RespectAbility) that focuses on broader disability inclusion (i.e., mobility, cognitive, visual, auditory) and is also highly experienced media representation
- RespectAbility can provide long-term benefits for LAX, through staff training and permanent infrastructure consulting
- They can also ensure that Olympic broadcasting groups effectively communicate LAX's accessibility efforts

By partnering with a disability awareness charity like RespectAbility, LAX can receive accessibility feedback and staff training to benefit for LA28 and beyond.

Heathrow Media Centre, RespectFirst, Whizz-Kidz

LAX can learn from DEN's digital marketing of its disability services to receive an increased budget

Digital Marketing

- DEN's website clearly states that it complies with Web Content Accessibility Guidelines (WCAG) to ensure digital accessibility for all potential travelers
  - LAX does not state that it complies with WCAG
- The website includes video tours with voiceovers to help passengers with cognitive disorders (e.g., autism) prepare for the airport environment
- DEN effectively advertises its services not only for those disabled, but for the benefit of all passengers
  - Helps motivate compliance from stakeholders
  - LAX can advertise accessibility related initiatives for the ability to reduce overall airport congestion

DEN's virtual tours illustrate potential hazards so that passenger can learn the airport layout before traveling

Budgeting

- Effective digital marketing can help LAX qualify for federal grants and receive more funding from the city
- DEN has been successful in the past to receive increased budget and funding for its projects

Federal Funding

- In 2023, the FAA awarded DEN with a $20M grant from the Airport Terminal Program (ATP) as part of the Bipartisan Infrastructure Law funding
- DEN advertised that this money would be put towards streamlining baggage claim systems and improving accessibility, aligning with ATP goals
- LAX should actively send proposals for ATP grants

Sharing Costs

- DEN pays around $79M annually to the city of Denver in an agreement to share certain resources (e.g., police and legal support), optimizing costs
- LAX could do the same, leveraging the increased budget towards accessibility related projects

By enhancing their website, LAX can seek to receive more federal funding and effectively share costs with the city of LA to fund more initiatives.

Distinguishing Short-term vs Long-term Solutions

Short-term, high impact solutions can be utilized by LAX to accommodate increased demand during LA28

Olympics Prioritizations

- LAX should focus on increased mobility services since a majority of Paralympics athletes have mobility impairments
  - Musculoskeletal impairments make up ~30.6% of Paralympic athletes, whereas sensory makes up only ~12.3%
- Mobility impairments are most pressing for LA28, but focus should shift back to equitable services beyond LA28

Temporary Infrastructure

- LAX should implement increased ambilifts, portable ramps, and temporary accessible chairs
  - Low-cost and one-time alternatives to permanent options that will go unused after the games end
- Extra benches and temporary rest areas can provide relief to passengers with mobility impairments

Temporary Service

- Introduce special temporary accessible shuttle services for specifically disabled passengers
  - LAX can partner with an NGO to link the airport to Olympic venues, hotels, or other transit areas
  - Allow disabled passengers to avoid rowdy, congested crowds of non-disabled passengers

Haneda Airport

Background

- While Tokyo hosted the 2020 Olympics, Haneda leveraged volunteer assistance squads to accommodate demand
- Volunteers embraced passion by greeting Paralympic athletes and providing assistance and emotional support

Implications

- LAX should use volunteer squads from NGOs (e.g., RespectAbility) to give staff training and feedback on services
- They can also foster a welcoming and inclusive airport culture, improving the overall passenger journey experience
- This is a low-cost alternative for LAX in relation to having to paying for additional staff and accessibility consulting

LAX should implement mobility-focused short-term solutions for LA28, such as increased structural resources and volunteer assistance squads from NGOs.

LAX should incorporate both short-term and long-term solutions in preparation for LA28 and beyond

Trade-offs Between Solutions

Short-term	Long-term
Volunteers are cheaper to allocate but less reliable in the long run	Well-trained staff can sustain quality over longer periods of time
Cheap and temporary solutions may require frequent re-investments	Permanent fixes require high upfront costs, but low maintenance costs
Short-term initiatives can be planned quickly, but are rather shallow	Long-term initiatives require prolonged, in-depth planning
Flexible solutions can be scaled up and down rapidly to meet demand	Not as flexible because they are costly and permanent investments

Short-term solutions can be a pilot program for long-term solutions in some scenarios (e.g., LA28 staff training can lead to routine, modular staff training)

Return on Investment

- Long-term investments can provide reputational ROI, positioning LAX as a world-class airport in terms of both accessibility and inclusivity
  - This recognition can attract a larger proportion of the disabled community to travel through LAX
- The number of travelers requiring assistance (e.g., disabled, elderly, injured) is steadily increasing, making long-term solutions more valuable YoY
  - In 2023, DOT received a 28% increase in the amount of disability service complaints from 2022

Operational Legacy

- Permanent accessibility solutions (e.g., tactile paving and Be My Eyes) will promote operational efficiency by prompting traveler independence
- Reduced airport congestion, resulting from long-term solutions, can ensure that other airport operations can efficiently proceed with no additional pressure
- Staff training can be a replicable model that can be used for all future disability assistance staff hirings

Short-term solutions can lay the foundation for incentivizing long-term implementations, which will provide a better ROI and operational efficiency for LAX in the future.

Agenda

Phase II Overview

Marketing

Innovative Solutions

Event Influx Preparation

Risks and Mitigation

Implementation

Appendix

Assessing LAMP Pain Points at LAX

The introduction of LAMP pathways creates an opportunity for many new passenger experience risks

Passenger Experience Risk Management

- Passengers must be aware of any outages, operational changes, and live wait times
  - Utilizing LAX app or a 3rd party app to ensure all customers are aware of relevant information
- All frontline staff will be interacting with passengers with disabilities including non-accessibility staff
  - Standardized ADA training protocols should be in place for influx of new LAX employees
- Implementation of comprehensive accessibility map for all LAMP infrastructure will assist passengers

Newark Liberty International Airport (EWR)

Background

- Working on a similar project to LAX's LAMP
- EWR had an operational air tram previously, but upgrading to a more efficient and compliant system

Implications

- EWR has implemented a strong connection to disability advocacy groups, which should be implemented by LAX as well find specific areas where services and infrastructure is lacking

Order of Implementation of Risk Management Strategies

Create Map	Standardize Training	Set-up App	Hire Advocacy Groups
• While LAMP is still in production, utilize all plans and current infrastructure to create an accessibility map	• ADA team should create guidelines around ADA training for all new LAX employees that are going to work at LAMP	• LAX should hire software engineers to improve LAX app to host LAMP info • Other option is work with Aira to add in their app	• Must be done after project is not a construction site • Examine LAMP grounds for oversights

LAX should complete all 4 risk mitigation strategies in the order above to make the LAMP project more accessible and easier to navigate for all passengers.

LAWA's LAMP project has many ADA oversights and possible issues in future projects within LAMP

Government Accountability Office (GAO)

Background

- GAO manages all AIP grants and accessibility funding is a permitted expense using AIP funds
- GAO does not standardize funding to ADA office

Implications

- ADA office funding is not federally standardized, resulting in airports being unaware of the best strategy to ensure full ADA and ACAA compliance
- GAO recommends strategic partnerships to lower costs and increase overall outcomes of projects

Tackling Issues with Budget in Mind

- LAMP project is being built without proper oversight due to LAX not getting specific federal direction on how to allocate funds to disability issues
- If budget constraints stay in place, LAX must focus on using AIP grants, capital improvement projects, and leverage federal funding mandates to fix ADA violations and issues altering passenger experience

Further Considerations

Actions	Effects
Ensure LAMP signage and signage contracts are ADA compliant	Easier for passengers navigate if signs are visible to everyone
Fix all locations with changing grades and improper curbs	Flat grades and low-grade ramps allow easier access
Ensure pathways are navigable for visually impaired passengers	All LAMP projects need improved tactile paving for autonomy
Work to keep elevators open for disabled passengers	Escalators should be the convenient choice for passengers
Increase ADA oversight immediately to find issues before too late	Protects FAA funding due to less ADA violations

Navigating future factors with budget in mind is necessary due to the lack of federal funding standardization at airports for ADA compliance.

Analysis of LAMP changes that will improve the experiences of mobility-impaired passengers

Feasibility Analysis of Wheelchair Assistance Improvements at LAMP

	Assertive Signage	Curb to Train Assistance	Specialized ADA Lane
Strategy	• Option 1: Signage or sticker claiming elevators are for wheelchair passengers only • Option 2: Signage or sticker with ADA logo on elevator	• Guide agents always situated at all LAMP zones to assist ADA compliant passengers • Long distance between drop-off zones and destinations	• Build a specialized ADA drop-off zone at AUX curbs • Drop-off zone is closer to elevators and allows for easier access of APM for passengers
Price Analysis	• Least expensive option because minimal to zero necessary infrastructure changes to LAMP project • No new employees required at launch of LAMP project in 2025 • Should be installed before LAMP project is completed	• Guides must travel from drop-off zones to elevators with passengers who cannot walk far using LAX wheelchairs • Requires an extended number of guides for passengers who only need help for distances ○ ~33% of wheelchair users	• Extremely difficult and expensive to implement • AUX curbs are in construction and changes in plans would be a challenge at this time • Could save on guides in the long term and require less expense mentioned to the left
LAX	• Easy to implement due to low cost, but may be thought of as disrespectful or aggressive	• Current infrastructure requires guides to assist passengers that cannot walk distances	• Low feasibility due to large but unquantifiable expense, but could save in long run

LAX can use assertive signage and increased curb to train assistance to ensure all mobility impaired passengers can reach the APM in the easiest and least expensive way.

Decreasing Costs

LAX should explore cost-effective and risk-conscious alternatives to some of their more expensive potential solutions

Wayfinding Upgrades

Issue: Need to improve wayfinding to enhance passenger independence in the airport
- Especially important for those who rely mainly on visual cues (i.e., deaf or hard of hearing)

High-Cost Solution: Install more signage around the airport and have staff ready if issues arise

Mitigation Strategy: Place QR codes that lead to digital wayfinding platforms that can provide detailed routes
- AccessAble provides Detailed Access Guides for travelers
- BindiMaps is blind-specific
- Routeme Wayfinding

Increasing Help

Issue: Long wait times for disability services lead to frustration and missed flights
- Wheelchair back-ups can be seen when accessing elevators after TSA screening

High-Cost Solution: Increase staff and expand infrastructure like elevators to avoid waiting

Mitigation Strategy: Expand LAX's Fast Track program for passengers with disabilities
- Passengers can inform airline when they will be arriving
- Can reduce TSA back-ups by spacing out timeslots for those with disabilities

Staff Training

Issue: Shops and restaurants can struggle to properly communicate with those that are hard of hearing or visually impaired
- Can not ensure they have ASL using staff or brail options

High-Cost Solution: Pay for staff training, even with high employee turnover, and check vendors often

Mitigation Strategy: Provide passengers with Aira for its Video Relay Service (VRS) function and with Be My Eyes
- VRS allows passengers to use ASL during the whole trip
- Be My Eyes aids navigation in stores without staff help

LAX should avoid large infrastructure changes and expenditures by providing passengers with digital alternatives such as apps, QR codes, and virtual queuing.

Aira, Be My Eyes, LAX, FTE, Routeme

LAX can further explore digital accessibility solutions on mobile devices to reduce costs and risks

Limited Call Point Solution

Issue: Wheelchair call points are limited, making it difficult for passengers to request services promptly

- LAX only has one call point at TBIT entrance and it lacks any prominent visual signage travelers
- Inaccessible for some hearing-impaired travelers

High-Cost Solution: Increase number of call points, ensuring they are installed at an accessible height for wheelchair users and include visual indicators, such as lights, for visual-impaired or have staff at curbside

Mitigation Strategy: Partner with and encourage use of customer service apps like Cérge Companion App, or place QR codes at drop-off for online customer services such as Hello Lamp Post

- Minimizes need for new extensive infrastructure
- delivers a higher ROI by broadening service availability to all passengers, not solely those requiring special assistance

Instant ASL Installation Solution

- Instant ASL translations on display screens through startups like Signapse and Deaf AI help deaf and hard of hearing with spoken announcements
- Apps like Hello Lamp Post avoid installation risks by providing convenient in-hand updates

Display Risks	App Solutions
Large-scale instant ASL would require significant investment	Apps are less costly, using ASL messages, at ~$400/month
Display screens are hard to customize as ownership varies	Avoids navigating ownership and splitting costs
For ASL users, written English is sometimes difficult	AI ASL like Signapse works well with apps and websites
Instant ASL is still new to airports and not widely available	Use app solutions now as technology is still being piloted

LAX can reduce installation costs associated with call points and mitigate the challenges of implementing real-time ASL by adopting app-based solutions.

FTE, Signapse

Key Performance Indicators

A comprehensive KPI framework built around four pillars of providing high-quality accessibility services

Service Area	Example KPIs	Methods	Benchmarks
Passenger Satisfaction: • Ensures LAX meets the expectations of travelers • Utilize journey mapping to isolate specific segments	• Passenger experience segmented by service area • Duration of airport trip from check-in to boarding • Average wait time	• Kiosks at key service areas to gather real-time data • Interviews and focus groups • Digital timestamp tracking of request-response times	• For the UK CAA, airports must have a satisfaction score of 4 of 5 and a wait time below 20 mins to receive a “good” rating
Staff and Training: • Measures preparedness and responsiveness of staff • Can help establish a reward system for staff motivation	• Staff-to-request ratio • Percentage of staff trained in accessibility protocols • Staff competency in assistance post-training	• Internal HR training records • Operational data including shifts and schedules • Post-assistance satisfaction surveys and/ or complaints	• The US DOT limits unattended time to 30 mins • All new employees should be trained when the new curriculum is implemented
Infrastructure: • Helps prioritize capital improvements and maintenance projects • Evaluate ADA-compliance	• Number of ADA-incompliance per vendor • Number of equipment damage incidents • Wayfinding difficulty	• Facility audits, inspections and maintenance logs • LAX TBIT’s WAIS-Track system for real-time equipment monitoring	• External credentials and ratings such as Rick Hansen Foundation Accessibility Certification can help set goals and metrics for LAX
Pilot Program Evaluation: • Evaluate the effectiveness of new technologies and services being tested prior to full-scale deployment	• Adoption rate of program • Portion of positive feedback from all stakeholders • Cost per assist or user under the new program	• Pilot usage analytics • Post-pilot satisfaction surveys sent to all parties • Stakeholder interviews and community feedback panels	• Many use reduced wait times and staff productivity to measure success • Review cost-effectiveness and financial tradeoffs

These categories ensure LAX tracks performance holistically, capturing the passenger experience as well as business operations for measurable progress.

LAX's dashboard with aggregate data and comprehensive KPIs will allow for real-time coordination and strategic planning

Significance of the Dashboard

- A centralized system to monitor accessibility services in real-time and improvements over time
- Enables more proactive decision-making and communication with vendors regarding future plans
- In the healthcare industry, dashboards reduced patient wait times by up to 30% by monitoring patient flow and resource allocation in real time

Costs and Considerations

- Cloud or on-premise systems may exceed $900K/year, but build cost reduces if new features are integrated into LAX's in-development dashboard
- Requires coordination with vendors, incentivized through reduced data analysis burdens
- REST API allows the dashboard to be integrated with external systems with role-based access

Applications of the Dashboard

Predicting Requests

- Collect number of wheelchair requests and overall foot traffic
- Predict number of requests by time, day and month
- Accuracy of the prediction is assessed to review model

Tracking Compliance

- Define service level agreement (SLA) (e.g., 15-min wait time)
- Automatic notifications when service exceeds SLA
- Analyze when SLA breaches occur and adjust staffing

Coordinating with Vendors

- Provide vendors access to relevant performance metrics
- Set delay or issue thresholds to auto-alert relevant vendors
- Identify issues and track progress in quarterly meetings

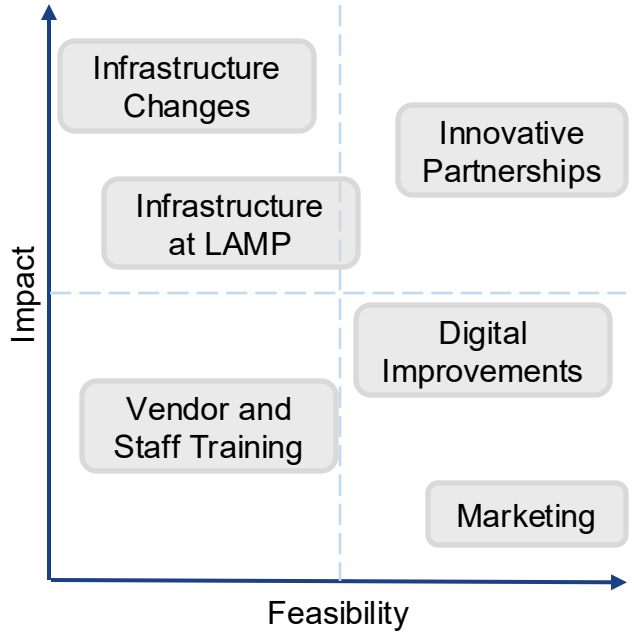

Despite the higher costs, the dashboard will enable LAX to forecast demand, monitor service delivery, and collaborate with vendors for more accountable accessibility support.

IBM, National Institute of Health, Reapmind Innovations

Prioritization and Implementation of Initiatives

Comparing impact and feasibility will help prioritize initiatives that provide the most significant benefits with manageable costs

Impact

Digital improvements and partnerships offer the best balance of impact and feasibility, while infrastructure changes, though impactful, are harder to implement.

Metrics

Impact

- Number of travelers benefiting from improved service
  - New infrastructure helps travelers with certain disabilities only, while apps can meet the needs of all travelers
- Scalability to meet future growth and increased demand
  - Digital tools and training allow for quick adaptation while infrastructure may require higher capital to scale
- Degree in which it aligns with ADA standards and regulations
  - While others may improve accessibility services indirectly, infrastructure changes will directly improve ADA-compliance

Feasibility

- Analyze financial resources required to implement the strategy
  - According to a UN study, existing infrastructure is much more costly than incorporating accessibility from the start
- Complexity of negotiations and the level of alignment with external stakeholders for ADA coordination and training
- Duration to complete the implementation of the strategy
- Ease of which it can be integrated into existing systems

LAX should prioritize digital, low-cost improvements in the short-run while negotiating and planning for large infrastructure projects within the terminals.

LAX should consider this phased implementation timeline for accessibility improvements

Prior to LAMP Completion → **After LAMP Completion**

Urgent and Immediate Fixes	Integrate New Infrastructure	Improve Terminals	Digital Improvements	Prepare for LA28
May '25 – Jul '25	*Jul '25 – Jan '26*	*Jan '26 – Jul '26*	*Jul '26 – Jul '27*	*Jul '27 – Jul '28*
Initial discussions for more complex and costly infrastructure projects in existing facilities/ terminals	ADA Compliance • Create ADA team of engineers • Determine current violations and negotiate change	Roll out training Digital options • Indoor mapping • Request-tracking dashboard	Build and pilot new infrastructure • Sensory, meditation rooms, gate remodel • Autonomous wheelchairs Communicate and finalize ADA regulations with vendors and third-party contractors	
Staff Training • Create handbook • Partner with disability advocacy groups to create training curriculum Set and adjust benchmarks based on data		Track success of pilot programs • New training curriculum • Data collection and integration through sensors and dashboard • Mobile app for service requests • Digital maps and wayfinding system		Train volunteers from universities Discuss future plans with external committee
Apply and use AIP funds for short-term fixes		Leverage PFC funds and apply to ATP grants		

Arrows indicate continuous action even after the set time

LAX should focus on fixing ADA violations at LAMP, securing funding, and collecting more comprehensive data about demand of accessibility services over the next year.

Summary of Findings

The various strategies provide LAWA a plan to launch LAMP and prepare for LA28 while meeting accessibility demand

Phase II Overview

- **Marketing:** Omnichannel strategy with ADA-optimized website updates, in-terminal signage, and multilingual campaigns complemented with internationally tailored messaging and partnerships to engage overseas travelers
- **Innovative Partnership Solutions:** Leverage partnerships with aviation-specific software to enhance independent navigation experience, prioritizing scalable, low-infrastructure tech that boosts autonomy and inclusivity
- **Preparation for Event Influx:** Use benchmarks from past host cities to create scalable service models with short-term flexibility through volunteers and infrastructure and long-term impact through training and permanent solutions
- **Risks and Mitigations:** Prioritize high-impact, low-cost initiatives and pursue grant funding for major infrastructure needs, while closely monitoring LAMP progress to proactively address ADA compliance before launch
- **Implementation and KPIs to Consider:** Recognize initiatives with high impact and feasibility by establishing demand, satisfaction, and efficiency KPIs, matching rollouts with infrastructure timelines and stakeholder alignment

Project Highlights

Identify Current Gaps

Assessed pain points across passenger experience and ADA protocols

Explore Solutions

Refined existing processes and discovered new opportunities and partnerships

Prioritize and Track Results

Identified relevant metrics and highlighted solutions prioritize and implement

In conjunction with LAX's current ADA services, LAX could close service gaps and meet rising accessibility demand by aligning marketing, partnerships, and infrastructure timelines.

Agenda

Phase II Overview

Marketing

Innovative Solutions

Event Influx Preparation

Risks and Mitigation

Implementation

Appendix

Digital and Media Presence

Influencer partnerships can amplify LAMP's accessibility features through authentic voices and inclusive stories

Maximizing Influencer Partnerships

Prioritizing Partnerships

- Disability travel influencers connect with niche audiences who trust their insights
- Mainstream family and lifestyle creators can serve to inform viewers about accessibility for broader audiences
- Mixed-ability creators (e.g., Deaf/hearing couples) highlight diverse and informative perspectives for travelers

Effective Content Formats

- Immersive vlogs offer walkthroughs of LAMP as well as tips from the perspective of a traveler with a disability
- Instagram Reels and TikTok's showcase accessibility features in quick, engaging formats
- Give creators creative freedom
- Collaborative blogs and guides provide long-form content for trip planning and SEO

Budgeting and ROI

- Micro-influencers can cost under $1K per post but drive highly engaged niche traffic
- Macro-influencers charge $5–10K+, ideal for milestone launches or broader campaigns
- Influencer storytelling has been shown to positively shift search behavior and boost bookings
- Videos are long lasting content so ROI increases continuously

Executing Influencer Collaborations

- Feature influencer content on LAX's digital channels to amplify it, also potentially reducing costs due to the promotion
- Create influencer briefing guides with tone, terminology, and ADA values to help creators represent LAX responsibly
- Make a feedback loop by encouraging audiences to submit accessibility questions that LAX can respond to
- Consider viewing Florida's partnership with @OurSignedWorld, a Deaf/hearing family, which works as a strong example of how influencers with disabilities can highlight accessibility in an engaging way which LAX can emulate

LAX should partner with authentic accessibility influencers to create content that both informs and works to make disabled travelers feel confident using LAMP.

Development Counsellors International, Hootsuite, NC Commerce Dept., Statista

TROJAN CONSULTING GROUP

Aligning strategy to each media type boosts visibility of LAX's accessible services

Broadcasting Mediums for LAX Media Coverage

	Television	Radio	Print and Online News
Strategy	• Pitch feature stories with strong visuals (e.g. accessibility tours, demo days) • Provide pre-recorded tours for broadcast segments	• Offer interviews, accessibility updates, and travel tips through live segments and ads • Promote use of LAMP to bring awareness towards it	• Publish guides and in-depth features about new accessibility services • Submit op-eds about new airport improvements
Rationale	• Local TV remains the most trusted and widely consumed news source in the US • Visual media can showcase locations of important accessibility upgrades	• Local public radio has a listening rate of 82% in the US • Key sources of information for those that prefer audio news, including those who are blind/low-vision individuals	• Digital news and online guides are crucial for travel decision making as it allows in-depth explanations and permanence • Often found by trip planners and shared online to group
Outlets	• NBC, ABC, Telemundo, and KTLA are major networks with wide reach and credibility • Local news can run special Olympic coverage and accessibility spotlights	• NPR, KNX, and KPCC are national stations trusted for public service info, so can be used for national updates • KOST 103.5 and KRTH 101.1 are LA's top listened stations	• LA Times, USA Today, Ability Magazine are highly read sources for travel planning, trusted by general and disabled audiences • Stature leads to global reach

Partnering with local TV for live accessibility demos, while sharing traveler guides in print and radio, positions the LAMP to be easy to use for LA28 visitors.

Nielson, NPR, Reuters Institute, Statista, University of Oxford

Understanding the most searched accessibility terms helps LAX tailor online information for LA28 travelers

Daily Volume of Searches by Term

Further Data

- There was a direct linear relationship between the quantity of times searched and the number of total search results
- The lengthier a phrase, the less amount of other search results appeared
- Globally these phrases were searched most in the USA, the United Kingdom, and Australia

Recommendations Based on Trends

- Prioritize titling content using the high-volume search terms to be able to capitalize on the high search traffic
  - Offset the number of results from simple phrases by adding further specifics to title (e.g., Disability Travel at LAX)
- Focus digital campaigns on regions with the highest searches, targeting travelers from the US, UK, and Australia
- Consider research into key words for non-English speaking countries to optimize SEO for international travelers
- Optimize SEO by balancing both short and long-tail keywords, ensuring content ranks well across a variety of search terms to increase organic visibility and drive more targeted traffic towards LAX digital resources

By mixing both short, frequently searched phrases with specifics tailored to LA28, LAX can optimize their search traffic drive more travelers to its digital resources.

A cost-effective segmented marketing strategy targeted toward domestic travelers is needed to raise APM awareness

Segmenting Offline Marketing Strategies for the APM

	Strategy	Integration	Effects
Pre-Launch	• Design posters and QR codes promoting LAMP to place throughout terminals and APM • Seek marketing partnerships with feeder airports nation-wide to advertise in their airport • Collaborate with airlines to promote APM and establish future marketing expansion	• Posters will cost <$500 per terminal and should be placed at drop-off zones and terminals • Ship printed posters for free to feeder airports (e.g. SFO) costing <$2.5K per airport • LAMP awareness reduces confusion which improves airlines on-time performance	• Successfully reaches all passengers at LAX including those with mobility disabilities • Cost-effective offline marketing strategy that offers scalable outreach and domestic flyers • Improves nation-wide airline operational performance by reducing late passengers
Post Launch	• Design navigational signage toward APM from terminals and baggage claim exits • Open a LAMP information desk near baggage claim and ITF stops for navigation help • Create a PA system loop announcement regarding the APM and LAMP information	• Print the same cost-effective posters for temporary guidance assistance ahead of LA28 • Reallocate employees from other service desks to avoid onboarding and training costs • Utilize existing PA system to broadcast LAMP service desks to reduce marketing costs	• Provides visual guidance to all passengers passing through baggage claim and ITF loops • Serves as both an in-person assistance model but also improves awareness of LAMP • Leverages existing technology systems to perform outreach on LAMPs efforts and services

LAX can maximize outreach and minimize costs by partnering with feeder airports and repurposing staff for LAMP services.

International Marketing

To maximize language visibility, LAX can prioritize best practices for multilingual and accessible digital content

Multi-Language Visibility

- Professionally translate key pages for high-traffic languages (Mandarin, Spanish, Arabic, etc.)
- Use hreflang tags to serve content in users' preferred language when on LAX websites
- Localize SEO keywords for each language to increase search reaches across different countries
- Ensure accessibility and readability in all translations (e.g., WCAG standards, plain language)
- Add multi-language help popups and chatbot support to website to support international travelers

Best Practices for Broadcasting

- Highlight real travelers who have disabilities in stories in videos, guides, and press materials
- Ensure all digital and broadcast content is accessible (captions, audio description, alt text)
- Partner with disability advocates and Paralympic athletes as spokespeople for news campaigns
- Announce upgrades through trusted local news sources and various community outlets
- Launch social media campaigns timed to Olympic milestones (e.g., LA28 countdown, facility openings)

Implementing International Broadcast Campaign

Audit Resources

- Audit the LAX's website and app for accessibility and multilingual access
- Start translation of content and identify top visitor language needs

Launch Upgrades

- Optimize SEO for each language and roll out accessibility tools
- Deploy updated website upgrades that allow for international accessibility

Expand and Promote

- Launch digital campaigns (e.g. social media) in major languages
- Partner with disability advocates for feedback and further outreach

Continuously Refine

- Monitor usage and traveler feedback to refine digital content
- Fully launch media campaigns and support channels up to LA28

Auditing LAX's web content for multilingual accessibility and implementing upgrades like a chatbot ensures key LAX information is discoverable and usable for all LA28 visitors.

Airport Council International, Think with Google, Web Accessibility Initiative

TROJAN CONSULTING GROUP

LAWA Asian marketing methods should leverage cultural understanding to properly frame its services

China

Key Audience Insight: Nearly all Chinese travelers plan and find activities through WeChat

- Expect to learn and find all their travel information and guides through WeChat

Cultural Sensitivity: Look to co-brand with China Disabled Persons Federation for credibility

Marketing Strategy: Launch a WeChat mini-program for group itinerary planning and information

- Increases outreach through a familiar touchpoint in WeChat
- Planning the trip prior to arrival allows for ample preparation for navigating the airport

South Korea

Key Audience Insight: Korean flyers share travel information through KaKao Talk and Naver

- Reach for familiarity through influencers on KaKao Channel and sources through Naver

Cultural Sensitivity: Frame messaging around respect for elders and achievement

Marketing Strategy: Push Naver and KaKaoTalk notifications and blogs for LAMP information

- Higher ad conversion rate through trustworthy sources
- Provides LAMP visibility to Navers >3M monthly users that are not using Google for info

Japan

Key Audience Insight: Also has an established user base on WeChat and KaKao Talk

- In top 5 countries of WeChat users with 5.5M and >117K monthly users for KaKao Talk

Cultural Sensitivity: Embrace a highly detailed marketing style to align with respect for protocol

Marketing Strategy: Seek partnerships with Japanese bloggers to post travel vlogs

- Japanese travelers can watch the vloggers use the APM
- Builds trust and clarity through credible influencers and shows a detailed step-by-step guide

LAWA should begin marketing to South Korea through KaKao Talk and Naver through messages and blogs to maximize LAMP outreach.

Lamp Specific

Navigating many aspects of the LAMP project is difficult for visually disabled passenger without improved tactile paving

Need for Tactile Paving

- APM Stations are difficult to navigate for individuals with with visual impairments because they are completely flat, have no tactile paving, and a lack of logical direction due to the lack of tactile structures
- Visually impaired passengers will need guides if unaccompanied by other passengers to be able to reach the APM due to the lack of navigating tools
- Inexpensive for LAX and semi-consistent in busier times due to crowds making it difficult to navigate without the assistance of a visual-impairment guide

Tactile Paving Alternatives

- Guides can be used to navigate all blind passengers through all LAMP facilities under ACAA
  - All visually disabled passengers relying on guides is expensive, does not allow for passenger autonomy, and is difficult in extremely busy times
- Audio signaling not available because outside and the area is open and loud from cars and train
- Tactile structures that can be used for guiding are not applicable in all sections due to the open environment needed under the APM stations

LAMP Tactile Paving Cost Breakdown

Equipment Price

- ~$22 per sq ft for fiber glass and polymer
- Steel and ceramic are priced higher, but may have lower upkeep costs

Equipment Needed

- Airports roughly have 0.1% of surfaces covered with tactile indicators
- LAMP project excluding ConRAC is ~5M sq ft

Installation Cost

- ~$10 dollars per sq ft before concrete is poured
- ~$30 per sq ft when concrete must be broken and then re-poured

Price Calculation

- If added prior to the concrete being poured it should cost ~$160k
- If concrete must be replaced, then ~$260k

The LAMP project must have tactile paving installed due to the current difficulty to navigate for disabled passengers, which should be possible due to low costs.

LAX's LAMP rollout will create an environment that may make it difficult for many different communication channels

Communication Mitigation Strategies

	Passenger ↔ All Staff	Airline Staff ↔ LAX Staff	LAMP ↔ Horseshoe
Risks	• Passengers requiring assistance struggling to find assistance at all LAMP sites • Passengers having multiple guides before reaching gate	• Arguments around jurisdiction and responsibility could impact passenger experience • Lack of communication could leave passengers stranded	• If accessibility employees move between LAMP locations and horseshoe, could result in an insufficient number of employees in either location
Challenges	• Must now specify where you will be dropped off now to receive assistance rather then standardized horseshoe • AUX curb is a distant journey; not optimal to have one guide	• Both parties want to minimize expenses, and minimize required jurisdiction in LAMP • Unorthodox nature of LAMP creates confusion about mandated jurisdiction	• Accessibility guides passing passengers off may solve this however it would also require a similar level of coordination • Requires everyone to be in the right place at right time
Mitigation	• Use LAX app to specify where assistance is needed and to allow for easier hand-offs • Guides must drop passengers off with another guide and never leave them alone	• All accessibility employees are contracted and then bill airlines or LAX depending on what assistance was provided ○ All guides will use identical communication platform	• Software system notifying the locations of all guides along with demand would allow for easier communication ○ Guide managers can map out demand through all LAX

LAWA must ensure all LAMP accessibility employees and passengers can communicate efficiently by utilizing the AIRA app and a standardized communication platform.

Gaining Insights from Other Host Airports

LAX can leverage the Paralympics to help advertise their new accessibility services

Communicating Services to the Public

	Media Partnership	Promotion Content	LAX Implementation
Tokyo Haneda Airport (HND)	• Haneda partnered with the Japan Broadcasting Corporation (NHK) to promote accessibility improvements • The International Paralympic Committee advertised Haneda's accessibility through its own social media platforms	• NHK brought lots of new attention to the Haneda airport • Haneda put Paralympic branding throughout airport terminals and transport hubs • This showed care for athletes in wheelchairs, reinforcing their dedication to accessibility	• Work with an Olympics broadcaster (e.g., NBC, Peacock, etc.) to showcase facilities during livestreams • Distribute Paralympics branding (e.g., posters, LED lights) throughout airport terminals and LAMP
Beijing Capital Airport (PEK)	• China Central Television (CCTV) live broadcasted the arrival of Paralympic athletes to the airport and its facilities • Their experience traveling with the new disability services at PEK was showcased to thousands of live viewers	• This indirectly advertised the wheelchair-accessible facilities to Olympics fans who may not have traveled to PEK before • 4.2K Paralympic athletes were shown efficiently traversing PEK, highlighting the success of these services to viewers	• Partner with a well-respected local broadcasting station (e.g., ABC7) to follow the airport arrival of athletes • Escort athletes using new disability services without explicitly having to advertise these services to the viewers

LAX can utilize the Paralympics as on opportunity to indirectly advertise new accessibility initiatives through media partnerships with broadcasting stations.

Cogitatio, LA Times

Similarly to DEN, LAX should enhance its methods of receiving and leveraging feedback on its disability services

Comparing DEN and LAX

DEN

- DEN plans to finish the $1.3B final phase of its Great Hall Project by 2027
- Projected 100M passengers between 2030 and 2035
- DEN is positioned as accessibility leader among US airports

LAX

- Comparable to the new infrastructure as a part of LAMP for 2028 (e.g., ConRAC)
- Projected similar demand of 90M passengers in 2028
- LAX can learn from DEN to improve its services before LA28

Learning from DEN

- DEN places equity across terminals and disabilities
- While LAX utilizes in-house training for disability awareness, Denver works with outside disability organizations for staff disability awareness training
- Proper staff training from experts ensures passengers can fully benefit from new infrastructure

House Bill 24-1542

Background

- HB 1452 mandates that DEN has a cross-disability advisory committee to assess disability services
- A cross-disability advisory committee, made up of individuals with different types of disabilities, ensures DEN provides equitable services
- DEN also leverages this committee to investigate new facilities during the process of construction to address problems sooner rather than later
- This bill also calls for DEN to create an online dashboard for passengers to record the airport's violations of accessibility requirements in real time

Implications

- This bill does not apply to California, but LAX can still seek to implement similar initiatives
- Currently, LAX prioritizes mobility assistance over other types of assistance (e.g., visual and auditory), so a cross-disability committee would solve this
- LAX should implement an online dashboard of real time complaints to foster an open environment, motivating them to address these concerns quicker

LAX should leverage a cross-disability advisory committee to ensure LAMP and other initiatives address all disabilities, as well as a real-time dashboard to promote feedback.

ACRP, Aviation Pros, DEN

LAX can adopt practices from DEN's capital improvement projects in preparation for increased demand by 2028

Great Hall Project

Daktronics LED Displays

DEN has 8K ultra-high-resolution LED displays behind the check-in counters of the international terminal

These displays span over 42K square feet of the terminal and consist of over 52M LED pixels

The LED displays even span seamlessly across 90-degree corners, ensuring viewing from all angles

Daktronics displays provide real-time wayfinding instruction for all steps of the traveling journey

The implementation of these LED displays have reduced terminal wait times by as much as 35%

Short-term solutions can be a pilot program for long-term solutions in some scenarios (e.g., LA28 staff training can lead to routine, modular staff training)

Other Initiatives

- DEN is a US leader in self-serve bag drop off stations with their installation of 86 of these stations across the Jeppesen International Terminal
  - Allows for passengers to get into the terminal (airline's area of jurisdiction) about 37% faster
  - Positioned adjacent to areas with airline staff to allow for swift assistance if there are problems
- DEN has placed visual pager monitors near flight information monitors and baggage carousels

LAX Implementation

- LAX already has self-serve bag drop off, but similarly to DEN, they can increase the amount of these stations, specifically at TBIT ahead of LA28
- Visual pager monitors can be utilized by LAX as an alternative to audible PSA announcements
- LAX can market such initiatives not only for the benefit of disabled passengers, but all passengers

By implementing LED displays, increased self-serve baggage drop off stations, and visual pager monitors, LAX can reduce congestion and wait times for all passengers.

Daktronics, DEN

Cost Breakdown

Focus on 3 main areas that will provide noticeable change to LAX's passenger experience in a cost-effective fashion

LAX ADA Office Investment Summary

	Digital Enhancements	Terminal Enhancements	ITF Updates
Strategy	• Improve accessibility features on website and add for LAMP • Use online assistance form and tracking tools to determine where help is needed	• Add accessibility help kiosks near gates and baggage claim • Install more tactile wayfinding paths for visually impaired passengers in open areas	• Update signage and call buttons at ITF stations • Improve loading zones for wheelchair access by making more curbs flat-graded
Cost	• ~$250K for website/app upgrades with out-of-house software engineers • ~$300K to implement digital tracking platform in LAX app using wayfinding software	• ~$500K for 20 accessibility kiosks and installation within LAMP stations and terminals • ~$350K for improved tactile paving and signage in terminals and LAMP locations	• ~$200K for added signage/call buttons for passengers requiring added assistance • ~$300K or more for curb redesigns to make more accessible with flat grades
Rationale	• Expands pre-arrival support for passengers with disabilities • Reduces staff burden by letting passengers opt-in to a tracking platform to hastily put in accessibility requests	• Provides instant in-terminal assistance access to all passengers without assistance • Helps visually impaired passengers navigate terminals and LAMP more safely	• Ensures compliance with ADA loading/unloading, signage, and wayfinding standards • Improves LAMP station usability for all passengers with mobility and visual disabilities

Digital and terminal enhancements paired with ITF updates are cost-effective and should be pursued by LAX, with immediate consideration towards ITF Updates to use LAMP's AIP budget.

LAX must design a centralized or multiple decentralized accessibility support centers at all LAMP stations

- Decentralized centers could be split up into 3 per-station and will be easier to access for passengers
- Centralized centers are larger and require more infrastructure per site, and are less convenient for passengers

Individual Strategy Cost Breakdown

Decentralized Accessibility Assistance Center

of accessibility centers: 15 x (Infrastructure expense: ~$300k + Operating cost: ~$500k) = Decentralized total: $12M

Centralized Accessibility Assistance Center

of accessibility centers: 5 x (Infrastructure expense: ~$500k + Operating cost: ~$1M) = Centralized total: $7.5M

Centralized accessibility centers are more cost effective at $7.5M

Centralized total: $7.5M x Airline Discount (60%): 0.4 = ~$3M after Airlines contribute especially in the operating costs section

LAX should implement a centralized accessibility counter at all 5 LAMP stations as it will be more cost effective and efficient.

Projected cost of all new ADA shuttles after LAMP project changes

ADA Shuttle Demand

- Shuttles will no longer be needed to arrive at ConRac and other locations, however shuttles will be needed still for inter-terminal transportation and back up shuttles need to be in place to take passengers from ITF's to terminals
- All rail-based systems require maintenance and get backed-up regularly, and due to the high stakes nature of an airport rail system, back up shuttles are always necessary and kept on hand other American airports
- There will be a reduction of current systems requiring shuttles, allowing for some shuttles to be repurposed

Individual Strategy Cost Breakdown for ADA Shuttle Demand

# of ADA Shuttle Routes: ~6	x	# of shuttles per route: 2	x	# of trips per shuttle daily: 40	=	Projected Shuttle Trips: 480		$360k represents the annual cost of all shuttles needed for LAMP project and horseshoe using contracted shuttles
Projected Shuttle Trips: 480	x	# of days shuttles used: 75	x	Cost per shuttle per trip: ~$10	=	ADA Shuttle Cost: $360k		

We expect this to be a large reduction in current expenses for shuttles however extremely necessary of an expense to ensure that in cases of APM maintenance that passengers with disabilities have access to ADA compliant shuttles

LAX must meet all passenger needs by adding ADA compliant shuttles going from each LAMP station in case of maintenance or back-ups as it is not a huge expense.

Tech-Driven Partnerships

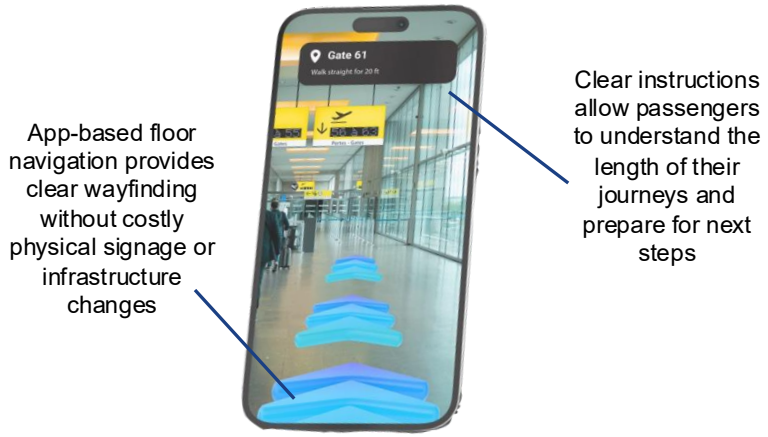

LAX can explore QR code solutions to improve passenger experience and navigation

Hello Lamp Post

- Hello Lamp Post creates AI-powered chats for a variety of different business sectors to save time on engagement and reduce operational costs
- Performed a trial partnership with AGS Airports' Glasgow Airport in attempt to reduce questions received by customer service staff, while placing an emphasis on creating a personalized journey
- The trial revealed positive results with:
  - *50% reduction in questions received by staff*
  - *>12.3K more passengers supported per year*
  - *86% satisfaction rate with service*
  - *>250 staff days saved*
  - *>33.8% passenger feedback*
- AGS expanded it to Southhampton Airport showing its high satisfaction levels and effectiveness
- LAX can install similar QR codes with Hello Lamp Post at high-traffic locations to provide real-time flight updates, navigation assistance, etc.
- LAX can contact AGS through FTE for cost details

Routeme Wayfinding

- Passengers receive instant wayfinding aid on their mobile devices by scanning QR codes or by NFRs
- It is available in 22 languages and automatically provides navigation in the user's preferred language
- For passengers with mobility impairments, the app automatically creates routes with elevators
- LAX can take advantage of Routeme's travel previews to reduce stress for neurodivergent passengers and its alternative paths to aid passengers without changing existing infrastructure

LAX should explore Hello Lamp Post and Routeme Wayfinding to improve passenger experience with minimal infrastructure changes.

FTE, Hello Lamp Post, Routeme Wayfinding

LAX can improve passenger experience by reducing waiting periods through the expansion of its Fast Track Lane program

LAX Fast Track Lane

- LAX provides free virtual queuing services in which passengers can reserve a timeslot for security screening
- Suggest suitable time slots based on flight schedules, the occupancy rate on each flight, and expected crowd levels
- Passengers can select the number of travelers in their group to ensure, eliminating the need for individual sign-ups

Other Security Timeslot Program Differences

Timeslots at Schiphol Airport

- Timeslots are available at all terminals at Schiphol but only available at Terminal 7 and 8 at LAX
- 15-minute grace period at Schiphol vs LAX's 30

ZENLINE at Lyon Airport

- Timeslots are opened 7 days before a flight departs at Lyon, but only 3 days before at LAX
- Reservation is registered onto boarding passes

LAX Improvements

- Extend the reservation window from 3 to 7 days before to allow passengers to plan further in advance, like Lyon
- Use Lyon's boarding pass tech to register the timeslot onto every group member's pass, rather than one QR code
- Fast Track originally in Terminals 7 and 8, but now website states availability only from 5am-1pm at Terminal 7
  - If this reduction was due to low reservation rates, LAX must advertise the program and secure more coverage
- Focus on encouraging passengers with disabilities to use Fast Track as it offers a quicker, less stressful experience
- If LAX successfully drives up usage rates, they should be less lenient and place a 15 minute late policy like Schiphol
- Update website as it currently describes Fast Track as a "new pilot program," but has been implemented since 2021

LAX should increase awareness to its Fast Track Lane and officially establish it as a permanent program to provide passengers, especially those with disabilities, a less stressful option

LAX can direct passengers to app-based tools that enhance passenger experience and airport operations

Potential Unaffiliated Apps

Flighty

- Flight-tracking app that predicts delays in advance
- Provides early warnings and exact delay reasoning
- Gives passengers information airlines typically do not, allowing informed decisions about travel plans
- **LAX benefit:** delay knowledge allows passengers to arrive at the airport later, preventing traffic in airport, stressful situations, and long waiting periods
  - Transparency can help prevent calls to airport

RogerVoice

- An app that transcribes phone calls, allowing users to read conversations in real-time on mobile device
- Available in 52 languages and 130 countries
- **LAX benefit:** conversations automatically archived, allowing users to reference calls for important details
  - LAX can encourage passengers with hearing impairments to use to facilitate customer service conversations, providing more effective help

Potential LAX Partner App

MagnusCards

- App that services neurodivergent users by providing visual how-to card decks for daily activities, helping them improve everyday experiences
- Has instructions for home and community activities through pictures and written and audio descriptions
  - Instructions currently available in 13 languages
- Uses Inclusion Partners which are businesses, brands, and venues to co-create decks for users
- Currently ~5 US airports have worked with Magnusmode to co-created instruction decks
  - On the app, each airport created ~5 card decks with ~10 instruction cards in each deck
  - Provides step-by-step instructions for activities associated with air travel, allowing neurodivergent travelers familiarize themselves with airport procedures and environments in advance
  - SFO and LAS have created decks that include topics such as “Boarding an Airplane,” “Airplane Check-in,” “Security Screening,” etc.

LAX can encourage passengers to use apps like Flighy and RogerVoice to improve customer service while also partnering with apps like MagnusCards to offer more personalized support.

LAS, Magnusmode, RogerVoice, Techcrunch

When partnering with NGOs and technology providers, LAX can leverage communication strategies to avoid conflict

Case Studies of Government Partnerships with NGOs

	Disability Initiative	Inclusive Education	Accessible Technology
Case	• Bangladesh government teamed with NGOs to aid people with disabilities (PwDs)	• Tanzania's government partnered with NGOs to adopt a model for inclusive education	• US Access Board worked with NGOs to prioritize and enforce inclusive AI advancements
Approach	• NGOs connected communities of PwDs to government tools • At project end, the government authorized an NGO, to continue connecting PwDs to social welfare services	• Created an Action Group with shared decision-making, alternating chairperson roles for balanced governance • Jointly review policies and collectively design initiatives	• Design a formal Memorandum of Understanding (MOU) to ensure shared commitment • Clearly delegate and define roles so each partner contributes distinct expertise

LAX Partnership Implementation Plan

- Form an action group with representatives from each party to align priorities and share expertise
  - Assign rotating chairpersons every 6 months, and hold monthly meetings with flexibility for emergency sessions
  - Use majority voting for initiatives and require full consensus for critical actions like public communications
- Create a MOU detailing obligations of each party, set key milestones and timeline, and data confidentiality rules
- Establish long-term initiatives, like connecting and referring partner organizations including Changing Paces or Open Doors Organization to airlines, to extend the impact of accessibility training and incentivize them to partner with LAX

Successful government-NGO collaborations for accessibility are built on aligned goals, clear and formalized roles, and shared decision-making.

Training Partnerships

Partnering with the Open Doors Organization offers more than just disability service training improvements

Open Doors Organization (ODO)

Overview

- Empowering businesses to serve the disability market while advancing accessibility in travel
- Offers custom workshops, customer simulations, and marketing strategies to boost ADA compliance
- Conducts studies on global disability travel spending and is a major carrier for airline staff training
- LAX does not have a direct partnership with the ODO but airlines do use ODO training for their staff

Implementation

- Adopt ODO's airline industry modules and tailor them for training APM staff in wheelchair handling
- Begin live simulation modules for emergency airport procedures, wheelchair handling, and encounters
- Terminal vendors can adopt ODO's accessibility audits to outline, target, and meet inclusivity goals
  - LAX can incentivize terminal vendors through visibility and PR awards, and accelerated permits

Implications and Effects

Operational

- Partnering with ODO would reduce strain on ADA coordinators efforts to audit and outline violations
- Properly trained staff would avoid bottlenecks which may come from the >4K daily assists by 2028
  - Bottlenecks at restrooms, gates, concessions, and security would reduce overall LAX operations
- Ensures consistency in accessibility practices for third-party operators through the consistent audit

Financial

- Cities like Qatar and Tokyo that invest in accessibility see $3.20 returned for every $1 spent
  - ROI includes improved traveler retention, enhanced ratings, and future partnerships
- Implementation would reduce the likelihood of receiving fines from the DOT and ACAA
- ODO's auditing frameworks would strengthen the applications for ADA specific federal grants

LAX should pursue a partnership with the ODO to improve disability service training, ensure continuity in overall airport operations, and boost long-term financial projections.

Changing Paces offers a global approach for training as a disability training partner

Changing Paces Overview

- The first company to develop and implement a customer service training system for Canada's accessibility laws
- Provides a variety of services with the intent to enhance accessibility and inclusion for businesses worldwide
  - Offers solutions like accesiBe, an AI-powered tool for users with disabilities to easily navigate their website
  - Created an online training program, Accessible Air, for employees to know how to handle any disability situation
  - Provides consulting services for hiring with disabilities and created a disability handbook to promote empathy

Implications for LAX

Methods

- Identify and benchmark quantifiable goals for LAX's disability service training with Changing Paces
- Implement workshops and training sessions through the Accessible Air online program for all employees

Effects

- Changing Paces' international work would provide LAX with a global perspective in training before LA28
- Provide training for LAX accessibility staff that differ from current approaches and methods of training

Key Issues

Challenges	Mitigation
Differences in US and Canadian disability compliance laws will require customization in the training program	Work closely with ADA coordinators at LAX to tailor online training methods to become ADA compliant
Long distance from Ontario to LAX would require multiple online calls for coordinating as opposed to in-person	Adopt a virtual program to pilot effectiveness, then begin a hybrid approach with in-person check ins

LAX should look to partner with Changing Paces to create a tailored hybrid training strategy to bring a global perspective through the accessibility training process.

Additional Risks and Mitigations

To successfully install sensory rooms, LAX must identify how to navigate potential risks

Addressing Sensory Room Installation Issues

	Construction Costs	Operational Costs
Issue	• Installation of sensory rooms can be costly • Navigating financial and jurisdictional complexities in airport terminals can be difficult	• Operational costs, especially staffing, pose as a barrier for sensory room additions at LAX • Full-time staffing may not be feasible currently
Mitigation	• Secure donations through sponsors, based on other airports, local non-profits are most beneficial ○ Explore Autism Speaks, Autism Society of Los Angeles, and The Help Group partnerships • Find airlines to donate airplane cabin experience spaces commonly found in sensory rooms	• Do not have staff working sensory rooms ○ Install cameras and require boarding pass to unlock door, ensuring passenger info is recorded in case of intentional damage ○ Include customer service call points • Can petition to government for a donated room
Example	• Pittsburgh International Airport's (PITT) sensory room was supported by donations from >10 sponsors including local autism awareness orgs, disability foundations, and charitable trusts ○ American Airlines donated realistic cabin room • Delta Air Lines co-donated the Airplane Simulation Zone to the Gerald Ford International Airport	• Despite not being staffed, sensory rooms at SFO are successful, as they allow passengers to use the rooms' functions as they please • Sky Harbor International Airport's sensory rooms were donated by the city government ○ Minimal costs as government continues to operated, staffed, and maintained the room

To best mitigate sensory room construction and operational costs, LAX must secure donations from local organizations and airlines and keep rooms unstaffed.

GRR, PITT, SFO, Sky Harbor ADA Coordinator, The Help Group

TROJAN CONSULTING GROUP

LAX needs to ensure rapid, organized and effective responses to crises to restore normal operations, and protect its reputation

Heathrow Airport

Background

- In March 2025, a fire at the North Hyde substation shut down Heathrow Airport for nearly 24 hours across all terminals, canceling or diverting >1.4K flights and impacting >250K passengers
- Incident triggered a blame game between the airport, the National Grid and airlines
- Resumed operations faster than anticipated due to centralized and timely communication

Implications

- Similar to airlines' crisis rooms, LAX should have a dedicated Crisis Management Center for real-time coordination and communication across terminals, airlines, emergency services, and the media
- LAX must pre-identify and pre-coordinate with alternate airports that can handle a sudden surge of travelers if LAX facilities are compromised
  - Formal agreements to ensure a reliable backup plan and allows for rapid resource reallocation, including accessibility services and ADA-compliant transport for travelers with disabilities

Communicating in Crises

Inter-Team Communication

- Normalize use of blue light phones as alert system by incorporating instructions in the handbook
- Consistently manage and monitor social media comments and kiosks for negative reviews of LAX
- Equip CMT teams with secure communication platforms independent of regular cell networks
- Ensure CMT and emergency responders maintain uninterrupted internal coordination

Public and Media Communication

- Use multi-channel systems (loudspeakers, SMS, and digital displays) to deliver clear public instructions
- Mark staffed information booths with physical signage or on mobile app for inquiries and recent updates
- Centralize all external messaging through CMT to ensure timely, accurate, and unified communications
- Issue a formal public statement from LAX leadership with transparent information to maintain public trust

LAX should have a dedicated crisis management team and all key staff should be familiar with an emergency plan of various scenarios in the event of a crisis.

To maintain momentum, quick improvements should be prioritized and communicated effectively to leadership

Communication Methods

- In preparation of LA28, establish and familiarize employees, vendors and leadership team with communication platforms such as Slack
  - This allows for a quick channel to notify leadership of issues and fixes in real-time
- Document specific action plans and report results and impact to leadership in regular meetings
  - Explain that quick fixes can be implemented immediately with minimal resources
  - Follow-up projects with data-driven impact

Ardent Health and Communication Tools

Background

- Ardent Health Services, struggled to communicate effectively with their nurses and physicians
- Emails and newsletters often led them to miss important information due to their busy schedule

Implications

- Adopted theEmployeeApp to provide a convenient, on-demand communication channel during COVID
- 18% increase in content production over a year

Purpose of Different Forms of Communication

Share Documentation	Meet Quarterly	Schedule 1:1 Meeting	Message on Slack
• Specific requests for resources and alternative options if necessary • Comprehensive timeline for ongoing projects	• Discuss passenger feedback from kiosks, surveys and interviews • Negotiate and align on strategic initiatives	• Focused on high-investment projects • Ensure all parties are onboard with objectives and expectations	• Facilitate quick, real-time communication • Address immediate concerns and time-sensitive information

Formally establishing different communication methods can help prioritize issues to be resolved to make decision-making more efficient.

KPIs

Implementing passenger experience and communication recommendations can best prepare LAX to hit future KPIs

Preparing for KPIs

Future KPIs	Preparation
Percent of new and previous LAX staff trained in ADA assistance protocols working in LAMP	Implement training protocol for all new and previous employees to complete by 2026
Percent of travelers requiring assistance leaving negative feedback traveling through any of the LAMP project stations	Administer all passenger experience recommendations and easy-to-use feedback systems to then further improve
Average staff response time to immediate assistance requests through all different pathways	Ensure communication between different pathways reaches guides hastily

Low-Cost Strategies

Training and Feedback

- Develop ADA training videos and digital modules for flexible and on-demand access of all LAX managers to distribute to employees
- Use peer-led or advocacy group sessions for in-terminal training of new and previous employees allowing for employees to improve together
- Launch QR-code-based feedback forms for passengers with disabilities to quickly report issues

Communication Across Pathways

- Add low-cost radio or app-based alert system linking accessibility guides across terminals
- Create pre-scripted response templates for emergency ADA support across all locations that direct passengers with mobility or visual disabilities
- Use airport-wide signage with accessibility icons directing passengers to staffed help points to assist passengers with visual and cognitive disabilities

Implementing passenger experience and communication recommendations can best prepare LAX to hit future LAMP project focused KPIs.

LAX should design a dashboard to aggregate accessibility data, enabling real-time responses and transparent communication

Announcements will allow the ADA department a direct communication platform to all vendors to inform about training and handbooks

The navigation panel is split into the 4 different categories mentioned previously

Access to feedback and data related to the user's business or department

Track real-time passenger satisfaction by area throughout the day and automatically send a notification whenever there is a significant drop

Quick real-time overview of the current situation at all terminals, updated throughout the day

Overview of number of wheelchair requests over time, derived from LAX's current data

Assess the need for more staff members at different terminals when the traffic at a terminal spikes at any time

Record the number of wheelchair requests that have been fulfilled, experienced long-wait times upon being fulfilled or failed to fulfill

A dashboard will centralize all data to help all parties at LAX track performance at any time.

Long-Term Solutions

LAX can leverage the Olympics in order to incentivize permanent, scalable accessibility enhancements

Long-term Solutions

	Physical Infrastructure	Digital Integrations	Staff Training
Solution	• Tactile Ground Surface Indicators (TGSIs) can be leveraged to guide passengers • Sensory rooms provide stress relief to disabled passengers	• Daktronics LED displays to airport reduce wait times • Digital apps (e.g., Be My Eyes) can aid autonomous wayfinding for passengers	• Rather than only providing staff training for LA28, LAX should focus on routinely training staff • This would increase comfort among disabled passengers
Scalability	• TGSIs are scalable since their placement can be expanded across terminals and touch points as time progresses • Sensory rooms can provide relief for all types of disabilities	• Like TGSIs, LED displays can be placed across terminals to be viewed from all angles • Be My Eyes is highly scalable because there is no limit to the number of users it can have	• Modular staff training can be given in the form of videos, which can be easily accessible for new staff at all times • Can involve training for non-disability roles (e.g., security)
Sustain	• TGSIs require different levels of maintenance costs based on the type of material utilized • Sensory rooms can result from repurposing existing lounges to assist numerous passengers	• Using LED displays, mobile apps, and other technology solutions will not require much maintenance costs, if any at all • Passengers will not have to rely on staff to guide them	• Ensures that all passengers receive equal treatment • Can be a key aspect of the on-boarding process, fostering a culture built upon disability awareness for years to come

Despite potential high upfront costs, long-term infrastructure, digital integrations, and staff training can be highly scalable and provide sustained impacts well beyond LA28.

Be My Eyes, Daktronics
