# Summary of Findings

# TCG developed a three-pronged approach to Phase II of research

## Our Objectives for Phase II

1. Identify key improvements for Omni's F&B strategy and determine how to implement changes effectively nationwide
2. Develop a plan that supports Omni's revenue goals through pricing, menu engineering, and check-size initiatives
3. Highlight technology that strengthens guest engagement, improves operations, and supports F&B improvements
4. Assess labor training and tracking to ensure consistency in service quality and operations across properties
5. Create targeted customer-capture strategies that convert hotel guests and locals into higher-value restaurant traffic

## Implementation of Phase II

### Conduct Insightful Primary Research with Experts

- **F&B Experts:** Connect with executives to understand operations and strategic priorities
- **Hospitality Academics:** Speak with researchers in hospitality and tourism to identify macro trends
- **Brand Directors:** Interview marketing professionals to uncover how brands build strong identities

### Explore Further Restaurant Operations Optimization

- **Menu Options:** Investigate menu data across restaurants to make appropriate recommendations
- **Server Practices:** Research what are the best ways to connect with customers while upselling
- **Discount Analysis:** Consider the effectiveness of Omni's current discount offerings and alternatives

### Solidify Messaging and Marketing Tactics

- **Marketing Channels:** Discover the most effective ways to drive diner traffic to Omni F&B outlets
- **Streamlined Messaging:** Understand how to effectively communicate F&B offerings
- **Activations:** Ensure messaging systems will reach the needed audience for restaurant activations

**TCG's three-pronged approach will ensure comprehensive insights to provide actionable and scalable implementations for Omni to grow F&B revenue.**

# F&B Trends

# Hotel F&B experiences must adopt value-driven consumption trends to satisfy and retain customers

## Current Trends within Hotel F&B Industry

- Value-driven consumption is the dominant consumer mindset, requiring hotel F&B experiences to consistently align every operational choice with guest social and ethical priorities in order to keep a competitive advantage
- Today's consumer expects their travel and dining choices to align with their core values, which has led to the convergence of two major macro-trends in hotel F&B, namely personal health and environmental sustainability

## Health and Wellness Focus

- 73% of consumers state that they plan vacations to better their mental, physical, and emotional health
- Omni's must position themselves as part of the wellness experience, ensuring every dining choice actively supports their guests' health goals
- 62% of people cite a drive for personal health as the reason for shifting consumption habits
  - Many consumers now seek vitamin and nutrient-dense items like superfoods and adaptogens
  - New wellness menu demands include plant-based options, vegan meals, gut-friendly ingredients, mocktails, and sugar-free desserts
- Omni can provide items like fresh-pressed juices, protein-rich vegan wraps, and sugar-free snacks to capture guests within this growing health segment

## Sustainability

- Guests are increasingly choosing brands that act in alignment with their environmental values
- To capture the 68% of surveyed consumers who prioritize sustainable F&B consumption, Omni's must strategically promote and transparently label its sustainable dishes and ingredients across all outlets
- Omni can capture more F&B revenue through greener efforts, as guests are willing to pay a 9.7% premium for sustainability sourced food products
  - Sustainability initiatives also enhance brand reputation and drive guest loyalty through increased customer trust and respect
- Omni should establish portfolio-wide standards for green initiatives to ensure a recognizable eco-friendly experience for guests across all properties

**Omni must embed and promote sustainably sourced ingredients and and nutrient-oriented F&B items across menus to appeal to guests' values, which subsequentially drives brand loyalty.**

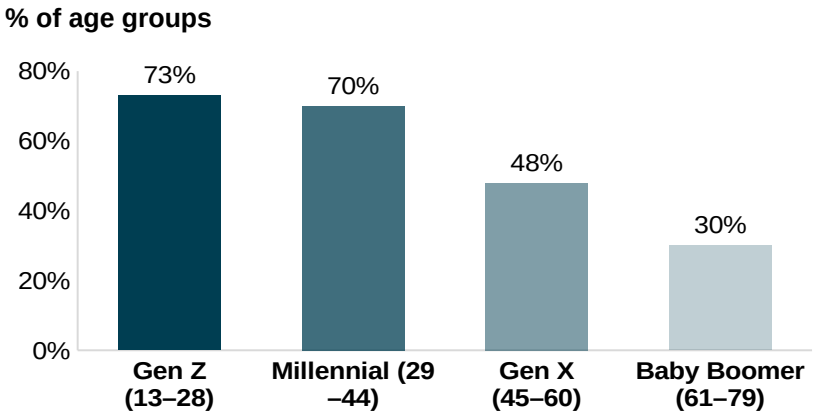

Agilysys, American Express, Hospitality Insights, LEK, PwC, Squirrel Systems

# Omni should focus on increasing its current culinary offerings into a series of experiential destination dining events

## Experiential Dining Services

- Guests now seek experiential dining concepts that create a strong sense of novelty and place
- Immersive dining experiences are an authentic way for Omni to deliver their sense of place philosophy
- A majority of all diners (55%) are interested in experiential offerings, and younger consumers are even more apt to find them most appealing
- By investing in experiential F&B, Omni can establish brand relevance with the future core consumers (Gen Z/Millennials), driving the initial acquisition of this long-term consumer segment

## Interest in Experiential Dining

## Celebrity Chef Partnerships

- Omni should expand partnerships with recognized chefs to offer exclusive experiential dining services
- Big names like Omni Kyndred Hearth's James Beard winner chef Ann Kim signals critically-acclaimed cuisine, making it a dining destination
- Omni should hire star chefs to generate out-of-market awareness at hotels without strong geographical pull to convert it into dining destination

## Signature Events

- Omni already demonstrates a strong foundation in creating "must-do" experiential dining events, and should expand these experiences to each property
- Unique dining experiences like the Hooked on Amelia Island event where guests get to catch and cook their own fish drives the "must-do" urgency
- Omni needs to shift the mindset from "Where do I stay?" to "I must stay at Omni to experience this"

**Omni should amplify its current offers in celebrity chef partnerships and signature dining events to meet a growing consumer demand for exclusive, experiential dining services.**

JII, Omni Website, Square

# Omni should consider partnering with established casual restaurants, so customers have confidence in the menu quality

## Hilton & Starbucks Partnership

**Background**

- Hilton partnered with Starbucks since 2013 to open Starbucks locations inside of their hotels
- These Starbucks locations often have limited menus, focusing more on convenience than variety

**Implications**

- Customers can easily get food from a trusted brand during their stay at a hotel, expecting the same quality that is associated with the Starbucks brand
- While the location may be convenient, the limited menu may result in dissatisfied customers if their usual Starbucks order is not available

## Localized Bars at the Moxy by Marriott

**Background**

- Moxy has themed bars that mimic the cuisine and culture of their host city
- The bars are integrated into the building, creating seamless access for hotel guests

**Implications**

- The locally themed bars are appealing to customers of the hotel and provide a unique experience
- Omni uses their localized bars to make each location unique, attempting to differentiate by geography
- Through unique cocktails, customers will sample more drinks which increases their overall spend

## Partnership vs. Independent Restaurant

- While partnerships offer reliable quality, they do not reinforce the hotel's brand, and they are often utilized out of convenience and comfort because customers associate the food and its quality with the chain and not the hotel
- Casual dining in Omni's hotels is through independent restaurants, such as Cast Iron, leading to more variety, but the variety can create uncertainty on menu offerings or ingredient quality which are critical for business travelers
- Omni should use chain restaurants to give comfort with consistency because the name of the chain ensures consistency and use independent restaurants to offer unique experiences to guests that want new experiences

**Independent restaurants can encompass local flavor, but they make it difficult for prospective customers to gauge food quality without an associated restaurant brand.**

# Implement boxed and to-go meals to capture busy hotel and local customers through quicker food options

## To-Go Customer Types

**Families**
- Seek fast meals before leaving hotel for day
- Often buy multiple items per purchase

**Pass Through Traffic**
- Local workers on short clock-out breaks
- Allow quick, repeatable online ordering

**Business Travelers**
- Meals must be easy to consume with no mess
- Meal needs to fit into bag and be resealable

**Off-Hours Customers**
- Want meals beyond hours of restaurants
- Usually early morning customers

## Westin Grab-n-Go Meals

**Background**
- Offers boxed, and to-go breakfast and lunch meals in the lobby for purchase
- Seasonally rotate their portable meal options to align with local vendors and seasonal flavors

**Implications**
- Captures busy business travelers during short breaks or on departure from the hotel for the day
- Reduces labor cost compared to sit-down options
- Grab-n-go meals need to be properly segmented to prevent encroachment on restaurant revenues

## Implementation of Grab-n-Go Food Options

- Consider expanding partnership with external supplier Sysco to provide boxed salads and wraps with less labor
- Make sure to-go offerings don't drive demand away from restaurants by offering different food options that focus on convenience and on-the-go consumption, instead capturing new, unrealized demand
- Curate menu of to-go boxes in partnership with current menu offerings and local flavors to align with brand goals
- Place boxes in multiple locations around the hotel, specifically near coffee stands and front desk areas with traffic
- Pilot these meals at Omni locations with large number of business travelers, such as Los Angeles and Atlanta

**On-the-go meals in partnership with Sysco offer an opportunity to drive more F&B revenue as long as they capture new guests instead of restaurant guests.**

# Competitor Analysis

# The new competitive edge within hospitality F&B fuses local authenticity with luxury experiential dining services

## Competitive Analysis on F&B Strategy

| | Loews Hotels & Co | Rosewood Hotels | Four Seasons |
|---|---|---|---|
| **Strategy** | • Flavor by Loews partners with cities' resident artisans to bring guests locally-known products<br>• Loews brings the best local dining experiences to the guest | • Partners in Provenance has a focus on partnering with local farms and food producers<br>• Rosewood presents diverse, seasonal menus of local fare | • Features expansion of concepts by chefs like Wolfgang Puck across hotels<br>• Oversee internal service to ensure consistency |
| **Results** | • Partnerships differentiate Loews' offerings from other chains<br>• Supporting community partnerships and local businesses captures guests seeking genuine experiences | • Using sustainable local ingredients is embraced by guests and the community<br>• Guests can seek out locally sourced food experiences right on-site conveniently | • Leverages chef credibility to signals that every amenity meets luxury standards<br>• Guests associate luxury service in both hotel and F&B, creating a cohesive experience |

## Securing Omni's Competitive Edge

- **Destination Markets:** Capture local market appeal by formalizing and advertising community-oriented partnerships
  - Partner with local culinary artisans and small producers and highlight local sourcing stories and community tie-ins
- **Major Cities:** Use nationally recognized chefs to create signature concepts that scale with local adaptations
  - Find high-caliber, acclaimed chefs while ensuring concepts have flexibility for local menu variations

**Omni should pursue local integration and create scalable partnerships that guarantee consistency and brand luxury recognition.**

Four Seasons, Loews Hotels,
Recommend, Rosewood Hotels

TROJAN CONSULTING GROUP

# Ambience and F&B self-sustainability are important strategies to drive profitability and capture local markets

## Importance of Ambience

- Diners in well-designed spaces spend an average of 12-20% more per visit and are 67% more likely to recommend the restaurant to others
- Functional design elements like seating are primary long-term determinants of customer satisfaction
  - Booth seating typically generates 10-15% higher checks than standard tables, due to increased privacy and a perceived higher level of comfort
- Lighting, color, acoustics, and layout work together to maximize customer satisfaction and profitability
- Ambience must be strategically engineered to align with Omni's restaurant concepts, target guest segments, and business objectives to be effective

## Standalone Success

- Hotel F&B must successfully attract non-resident diners, meaning they must function as standalone commercial concepts in parallel to the hotel
- The industry benchmark for commercial viability requires hotel F&B to generate >40% of its business from non-hotel guests to secure decent returns
- F&B offerings must be relevant to the local market, and the menu, service, and ambiance must align with the expectations of the local population
- Investing in a unique, standalone F&B concept is a good mechanism for boosting profitability
  - An independent restaurant can also be a powerful destination anchor, increasing the hotel appeal

## Implications for Omni

- Omni must invest in calibrating ambience elements like lighting, acoustics, and layouts to fit each dining experience
  - The harmony of these elements can increase guest average spend, satisfaction, and drive repeat visits
- Omni should invest in a unique, highly localized, standalone concept, as it is no longer optional in the luxury market
  - In today's competitive landscape, standalone success will differentiate Omni and create more brand relevance
- By recognizing the relationship between functional design and commercial dependence, Omni should transform its F&B operations from a well-developed hotel amenity support into a highly profitable, self-sustaining business unit

**For Omni to boost F&B operations profitability, Omni must prioritize investing in a highly localized standalone F&B concept with well-developed ambiance.**

# Scenario Analysis

# Quantifying the 7% revenue increase requires breaking down target growth goals into check and item metrics

## Noé's Performance Metrics and Revenue Target

| Metric | YTD Performance | 7% Growth Target | Required Increase |
|---|---|---|---|
| Net Sales | Redacted | | |
| Check Count | | | |
| Average Check | | | |

## Average Item Price (AIP) and Items Per Check (IPC)

YTD Net Sales: [redacted] / Total Number of Items Sold: [redacted] = **Average Item Price (AIP):** [redacted]

Average Spend/Check: [redacted] / Average Item Price (AIP): [redacted] = **Items Per Check (IPC):** [redacted]

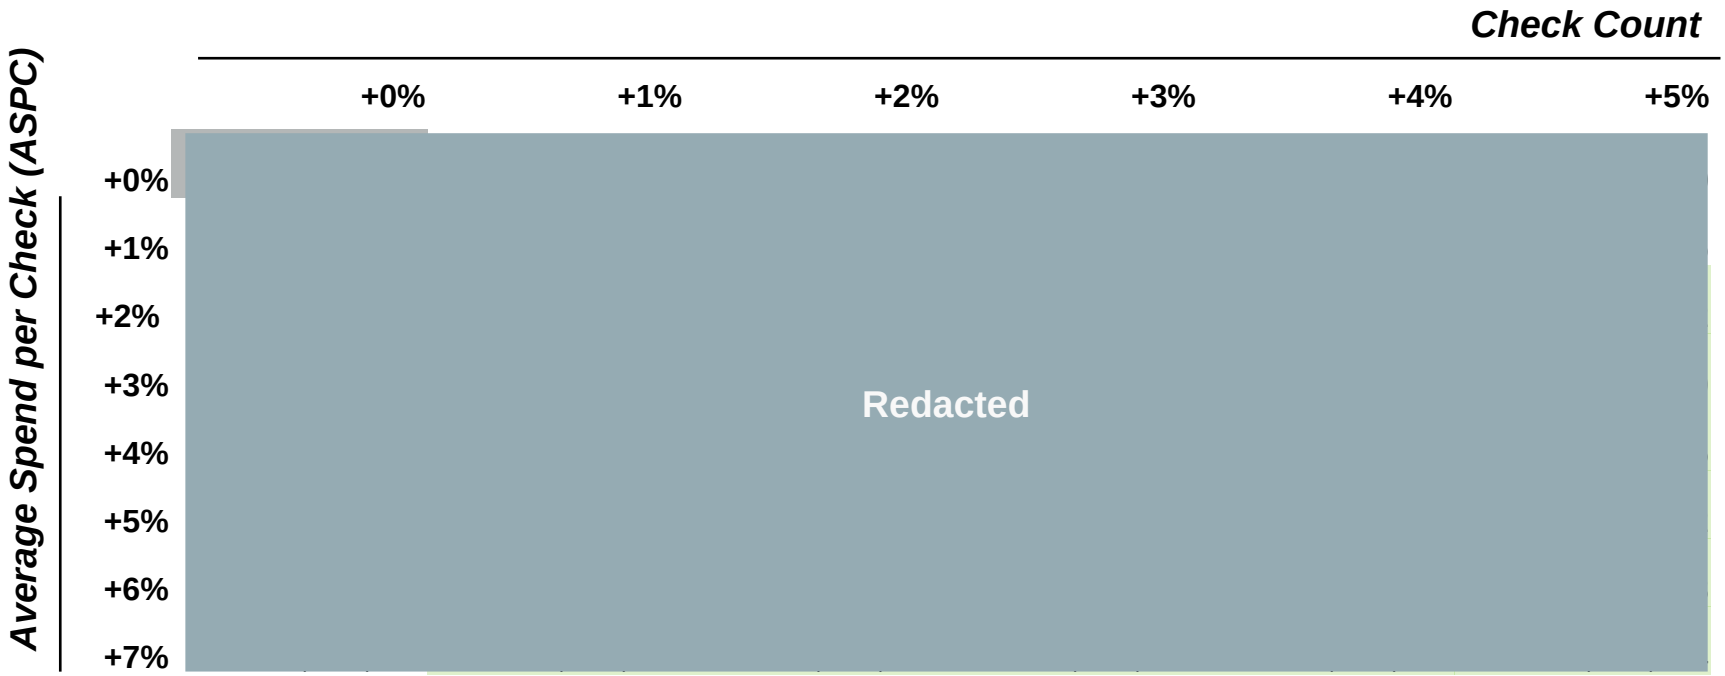

**IPC and AIP are the levers to increase after a guest is seated to maximize the value of that visit**

**To hit the target average check amount, Omni should maximize both the AIP and the IPC to hit both price and volume.**

# Sensitivity analysis on price and volume increases for Noé

- Using data from Omni LA's Noé, this matrix models the required combinations of Average Spend per Check (ASPC) growth and Check Count growth needed to achieve the target revenue goal of [redacted], highlighted in green

## Average Spend per Check (ASPC) vs. Check Count

*(Grey = Base Case, Green = Successful Scenario)*

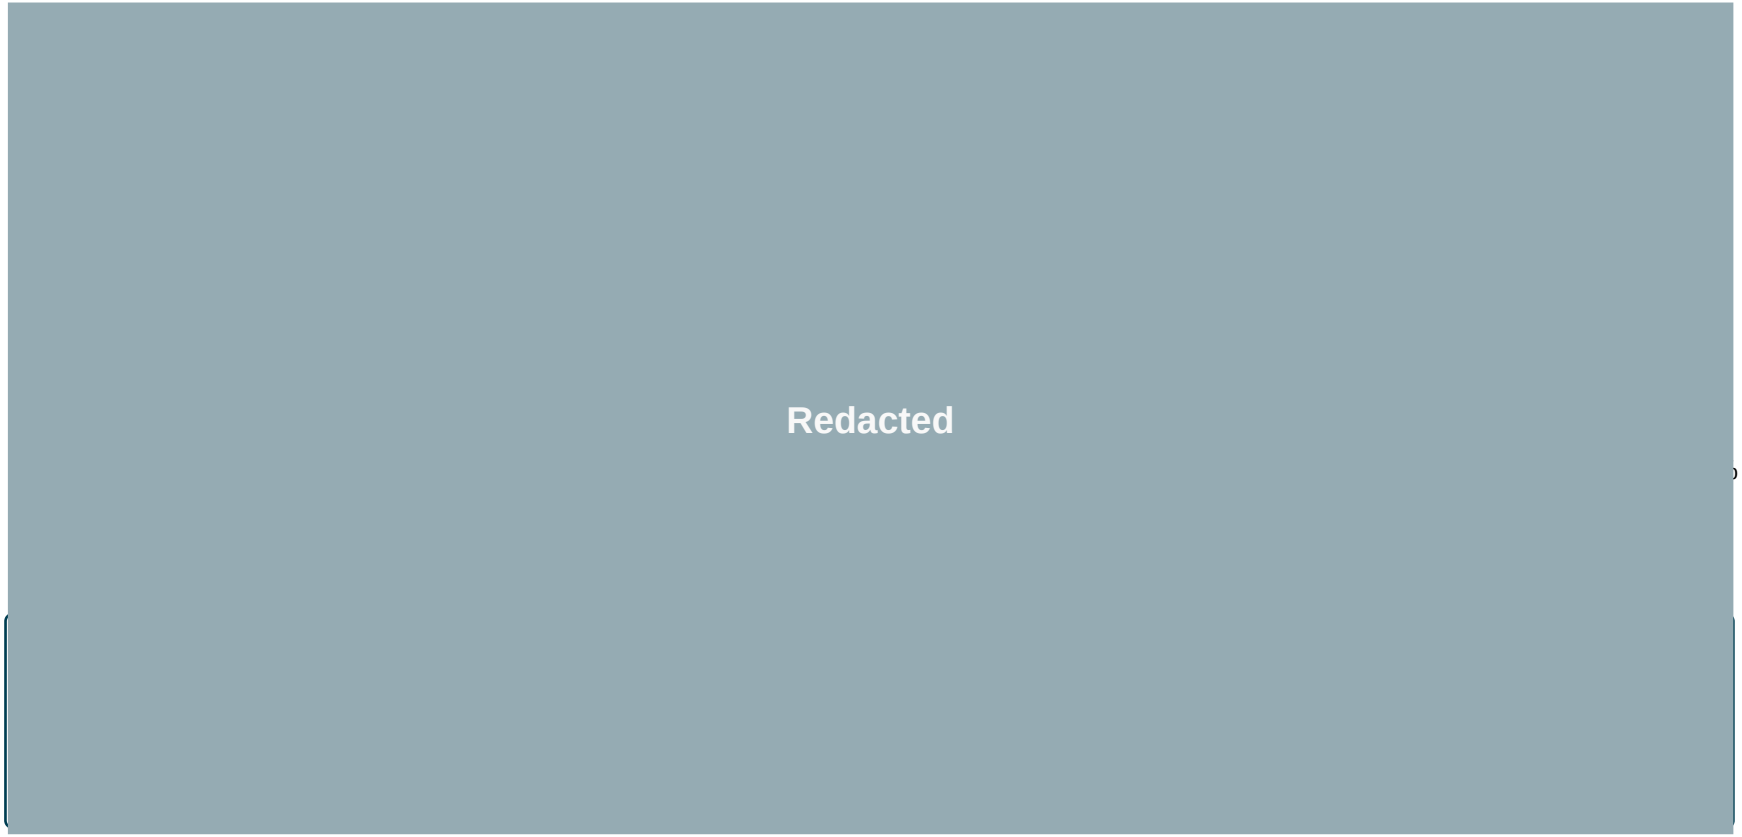

**The most attractive solutions are where moderate increases in both metrics intersect to balance the difficulty of attracting new customers with the risk of price hikes.**

# High Margin Item Revenue Breakdown

# Beverage share of revenue drives performance at Whiskey & Rye (W&R), while Noé remains food-driven

**W&R Monthly Beverage % vs. Total Revenue**

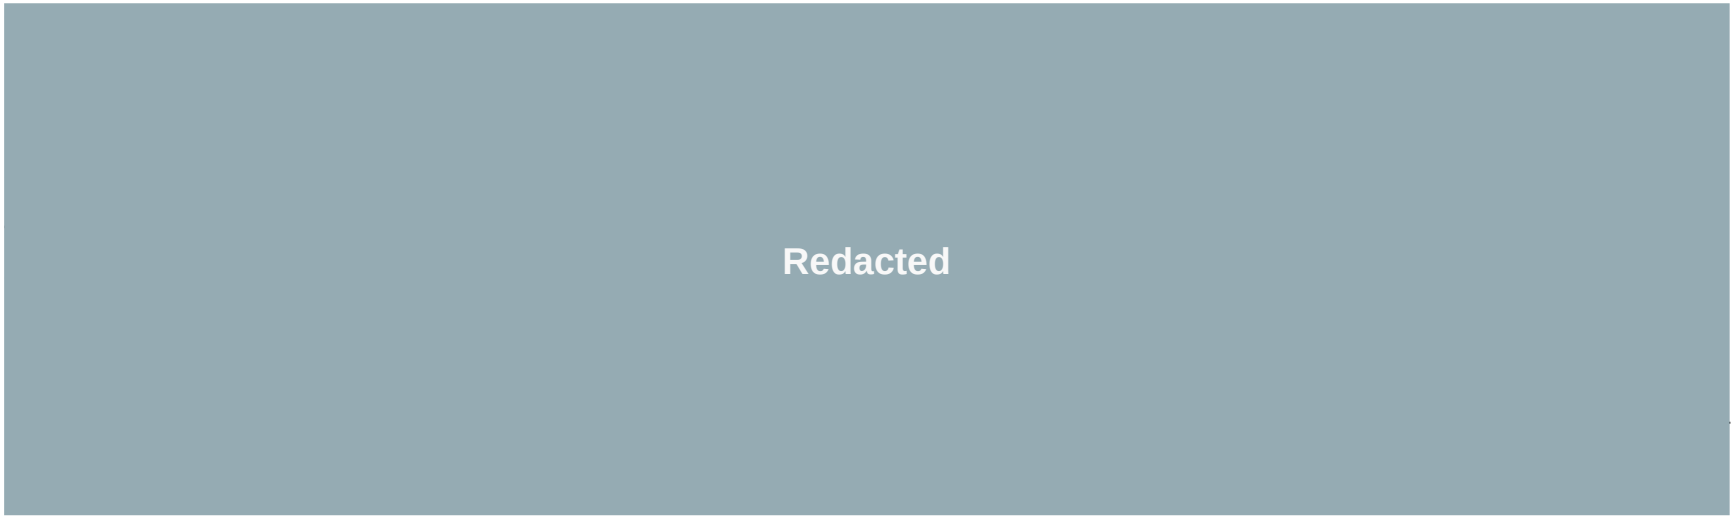

**Noé Monthly Beverage % vs. Total Revenue**

**Omni's F&B reliance on beverages varies by location, thus distinct strategies must be applied for drink-led and food-led restaurants to best drive profitability.**

# Analyzing day-of-week revenue across venues highlights how beverage revenue share and guest traffic drive weekly patterns

## Beverage and Food Revenue by Day of Week at Whiskey & Rye (W&R) and Noé

## Pattern Comparisons

- Heavy weekend reliance at both, [redacted]
- [redacted], underscoring heavy dependence on peak nights
- Sun and Mon are clear pain days, showing the lowest revenue and weakest beverage mix at both venues
- W&R has early weekend momentum, not prominent at Noé, [redacted]
- Noé's weekday dips are milder, but overall days remain lower revenue than W&R, reflecting its food-led model
- Both follow the same weekly pattern, but for different reasons: W&R peaks with bar demand, Noé with dining traffic

**Food-driven restaurants lack large revenue spikes, so increasing beverage share is an effective strategy to expand profitability beyond standard guest-volume growth.**

# W&R, and other bar-forward restaurants, can take advantage of high beverage traffic to drive food revenue simultaneously

## Menu Upgrades

- 77% bev share suggests W&R captures guests effectively for drinks but can't convert them for food
- Ordering food increases guest time spent at the bar which leads to more beverage orders
- Goal is to make food more visible, more "snackable," and easier for diners to order impulsively
  - W&R already uses "bar bites" and other terminology which should be used at all bars
- Each food item already has short descriptions so a drink pairing suggestions can be added

## Holiday Emphasis

- W&R shows little evidence of leveraging natural demand surges tied to drinking holidays
- To lift food capture, suggest holiday-themed food offerings aligned with available drinks
  - On Cinco de Mayo, emphasize current offerings that align (chips and queso and street tacos) and consider adding new dishes to pair with drinks
- This can shape "Drink and Bite" bundles with set prices (e.g., beer and slider) available during holidays and peak beverage days (Thu-Sat)

- W&R allows guests build their own cocktails, and can also allow diners to build own snack board, a customization method that drives spontaneous profitable add-ons, allowing diners to feel engaged, and uses available ingredients

**Omni bar concepts can encourage spontaneous food purchases through menu changes and the creation of food and beverage bundles during peak-traffic.**

# AI Pricing Tool Implementation

# Comparative evaluation of leading AI-enabled pricing platforms to identify the best fit for Omni's needs

## Comparison of AI-Enabled Pricing Platforms

| | Restaurant365 | CLEARCOGS | toast |
|---|---|---|---|
| **Menu Engineering** | Auto vendor price updates, menu matrix analysis, and direct recommendations for prices | Real-time actual vs theoretical (AvT) COGS, but does not suggest optimal menu mix | Good basic cost tracking via Toast POS, but lack analysis on menu matrix and predictions |
| **Price Change Workflow** | Direct price suggestion and batch menu updates from dashboard, see impacts in cash instantly | Identifies COGS spikes, but pricing implications must be manually interpreted | Edit prices in POS dashboard directly for instant updates but menu requires manual review |
| **Forecasting/ AI Analytics** | Specializes in long-term trends but no advanced day-to-day labor or ingredient use | Best demand forecast: predicts shifts in sales, trends, event-driven spikes, and labor needs | POS-driven sales forecasting, focused on historical data over predictive modelling |
| **System Integration** | Deeply integrated with vendor invoices, accounting, purchasing, labor scheduling, and logistics | API connectors for major POS, inventory, and labor platforms, supports large enterprise data | Native integration with Toast add-ons (POS, loyalty, online order), but not advanced COGS |
| **Report Range** | Item-level P&L, COGS reports, and more with direct menu engineering and pricing insights | Focused on operational insights: dashboards for demand trends, inventory alerts, waste reporting | Sales, labor, item rankings, benchmarks, best for real-time operational reporting |
| **Training and Support** | Multi-location onboarding, frequent training webinars, high-touch support for rollouts | Dedicated hospitality support team, manager onboarding for interpreting forecasts | Extensive Toast training modules, online guides, hands-on onboarding |

**Omni should use Restaurant365 along side ClearCOGS as they offer the strongest end-to-end capabilities, making them the most scalable and immediately actionable solutions for Omni.**

# Integrating Restaurant365 and ClearCOGS enables a data-driven quarterly pricing review process for Omni

## Software Pricing

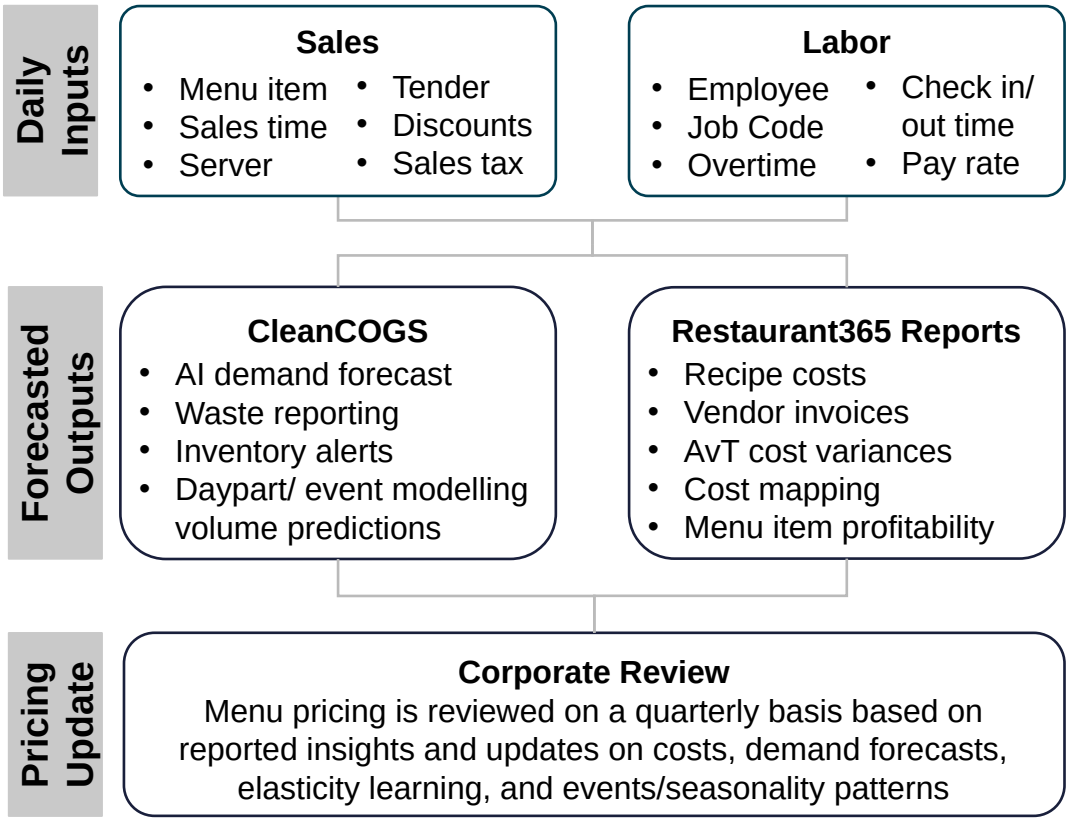

### Restaurant365

- Professional plan (essential + custom reports, fixed assets, advanced business analytics) is $749 per location per month
- May require a custom quote given the specialized needs of Omni
- Implementation fee is $1,000+ depending on number of locations and integration complexity

### ClearCOGS

- Pricing is customized based on based on restaurant size, number of locations, type of operation, depth of forecasting required and POS/integration needs
- Can receive estimated price by booking a meeting and demo

## Quarterly Review Cycle

**Omni should adopt R365 and ClearCOGS together to build a reliable quarterly pricing system powered by accurate costs, demand forecasts, and operational insights.**

# A 3-step approach for Omni to integrate and roll out operational software to improve quarterly pricing reviews

| Data Foundation | Pilot Rollout | National Rollout |
|---|---|---|
| Build technical backbone needed for accurate forecasts and data analyses for pricing decisions | Test accuracy, economics and adoption in controlled environment before rolling out in more locations | Scale AI-driven pricing across all restaurants with a consistent quarterly review process |
| **SKU Standardization:** Consistent and comprehensive vendors, item names, recipes, portion sizes, etc. | **Launch Pilot:** Begin adoption with Omni LA's Noé Restaurant and Bar and Omni Frisco's NHS | **National Expansion:** Staggered roll out across all restaurants, begin with cleaning data |
| **Connect POS to Software:** Automate daily sales data feed with full item and transaction detail | **Weekly Price Trials:** Run weekly test recommendations for validation without publishing prices | **Corporate Pricing Dashboard:** Communicate with software providers on centralized reports |
| **Vendor Pricing Integration:** Sync invoices, recipes and ingredient costs for cost baselines | **Quarterly Pricing Cycle Test:** Conduct full quarterly price cycle using model and compare results | **Pricing Update System Launch:** Generates COGS report and recommendations for pricing |
| **Pricing Governance:** Formalize pricing review including who is involved and approval process | **Feedback Loops:** Test recommended prices and gather insights from chefs and guests | **Ongoing Enhancements:** Fine-tune elasticity models and introduce regional factors |

**With standardized data and integration with current POS system, Omni can launch a data-driven pricing strategy in phases, beginning with target hotels and restaurants.**

# Digital Interface Improvements

# Omni must continue to improve digital in-room ordering tools for room service ordering

## Hilton Hotels QR Codes

**Background**

- Hilton implemented in-room QR codes to order room service at over 160 locations across China
- The QR code takes consumer directly to web-menu requiring no downloads or sign-ins

**Implications**

- Place QR codes on in-room menus or on keycards to allow easy customer access and navigation
- Online menu must be easy to navigate so customers can compare different meal options
- QR codes, must be well labeled and mentioned throughout the check-in process to increase sales

## Boston Harbor Hotel

**Background**

- Implemented Intelity guest facing technology, using in-room tablets to showcase offerings
- Orders through Intelity system are directly routed to the restaurant kitchen software, reducing costs

**Implications**

- Having in-room technology allows for upsells and tailored promotions using guest loyalty numbers
- Total in-room dining revenue increased 16.4% after implementation of Intelity systems
- Reduced order friction in combination with targeted ads improves chances for impulse purchases

## Effective Digital Ordering

- Omni must clearly label and alert customers of QR codes during check-in to ensure customers know of RIR options
- Whether through Intelity or QR code systems, order friction must be minimized, ordering online should be seamless and quick, allowing customers to see all options while minimizing decision making time
- Switching from Omni's current QR code system to the Intelity system will increase sales, but requires up-front investments into the technology and installation of in-room tablets which can cost up to $200 a room up-front
- Improved advertising reach and other in-room tech applications like service requests will help offset startup costs

**Digital ordering is critical for room service, but menu friction must be minimized and room service options must be clearly labeled to maximize order quantity.**

# In-house or external implementation of in-room ordering technology helps to improve operational efficiency

## Benefits of In-Room Tablets

- Hotels save an average of $150 per room per year by replacing printed info cards and menus with digital options
- 80% of guests interact with in-room tablet compared to 3% that interact with QR codes posted in-room
- Having customers submit their service requests, such as extra towels or pillows, through tablets increases guest handling request efficiency by 80%, filling requests more quickly and requiring fewer staff to meet requests
  - Guest preferences can be tracked through the room tablet, allowing for experience personalization on later stays
- Customer incidentals cover damages to the tablets after their initial implementation, reducing ongoing costs

## $0 Upfront System with Revenue Sharing

- SuitePad is a third party in-room tablet company that will install their system and take a cut of profits

### Strengths

- Can utilize $0 upfront to pilot in-room tech
- Omni would not need to design their own software technology
- Allows Omni to pay for only the features that they use

### Weaknesses

- Takes 70% of incremental profits through their system
- SuitePad software may not integrate with current tech
- UI options are not customizable

## Wholesale Implementation

- In-House tablet implementation will be executed on a large scale and require significant upfront costs

### Strengths

- Allows for a greater 100% share of profits
- Can be made compatible with existing backend
- Customizable interface aligns with Omni's brand identity

### Weaknesses

- Requires upfront investment of $80-$150 a room
- Software must be created in-house, costing $30k-$90k
- Software updates are difficult to implement

**Using a $0 upfront tablet plan will allow Omni to pilot in-room technology at 1-3 hotels and choose a full-scale implementation plan based on results.**

CBS Insights, Hospitality Net, Mclarenint

# Omni should use digital menu browsing and geolocation nudges via an app while mitigating risks associated with digital integration

## Menu Browsing

- 43% of guests said that easy-to-find online menus would persuade them to eat at the hotel restaurant
- Guests should have access full digital menus on the app with professional food photography, nutritional information, and dietary filters
- Guests who browse and plan meals pre-arrival are more likely to dine in-house rather than off property
- The app should allow guests to save favorite items or specify meal and service preferences so that staff can prepare experiences at check-in

## Geolocation Messaging with App

- When guests are detected to be near dining venues, the app should send notifications that showcase daily specials, or events happening
  - E.g., “Come try our pool bar’s happy-hour drinks!”
- Guests often wander without full awareness of dining options, and passive discovery increases restaurant foot traffic and awareness
- Captures guests who might otherwise opt for off-property dining with simple nudges

## Risk Considerations and Mitigations

### QR Code Accessibility

- Not all guests will download a native Omni app
- Properties should maintain QR code access points in rooms, restaurants, and public areas that route to a web app version of key ordering functions
- Convenient for one-time or non-hotel guests

### Data Privacy

- Guests may hesitate to share personal preferences, dietary needs, or location sharing
- Omni should clearly state how the data will be used (e.g., "to personalize your stay and offer better services") and offer a opt-out of certain features

### Accessibility

- The app may confuse older guests or guests with visual impairments and minimal digital literacy
- Ensure the digital interface adheres to basic WCAG (Web Content Accessibility Guidelines) principles and offer an accessibility mode

**By providing pre-arrival menu planning and geo-located offers, Omni can increase in-house dining conversion while maintaining standards for data privacy and accessibility.**

# Table of Contents

# Discount Loss Analysis

# Creating incremental revenue growth and redefining hotel restaurants as profit-driving assets

## Inefficient Discount Strategy

- Omni's current 15% coupons may be leading to high cannibalization and negatively impacting brand value
- Promotions are applied uniformly without accounting for local occupancy patterns or seasonal fluctuations
- F&B performance data is siloed, preventing teams from identifying when new demand is generated
- Such frequent promotions dilute perceived restaurant value and train guests to only dine with discounts
- Current methods promote cannibalization of guests, decaying margins, and decreased brand perception

## Profitability vs. Amenity

- Omni restaurants are intended to enhance the guest stay but need visibility as independent destinations
- Marketing across websites and staff interactions lack a balance between convenience and experience
- Local integration exists but is missing a standardized approach to ensure consistency across properties
- Some of Omni's F&B locations functions as a service amenity rather than a revenue growth driver

## Loews Hotels

**Background**

- Loews launched the "Flavor by Loews Hotels" initiative to bring authentic, local dining experiences
- On the website, Loews highlights the value-add of bringing these flavors and experiences to corporate travelers who may not have time to explore the city
- Offers limited, collaborative promotions, enabling Loews to create new traffic during off-peak periods
- Both guest satisfaction and profitability are tracked, ensuring brand equity and incremental revenue

**Implications**

- Omni should treat local dining as an intentional extension of the destination, not just an amenity
  - Begin tracking local versus hotel diner mix
- Leadership should evaluate restaurants on their ability to elevate guest experience and profitability
  - Conduct recurring reviews linking P&L to CRM
- Discounting should shift from static discounts to time-bound promotions that attract new diners
  - Launch locally catered events during low-traffic

**Through intentional promotional strategies to attract incremental demand, Omni can transform F&B from a passive amenity service into a purposeful revenue driver.**

# Calculating the expected ceiling of discount revenue loss in LA from January to September 2025

## Methodology and Assumptions

Redacted

## 15% Discount Ceiling Calculations

Revenue charged to room pre discount: [redacted] x Noe's standard hotel guest F&B discount: 15% = **Expected discount volume charged to rooms:** [redacted]

Revenue from credit cards pre discount: [redacted] x Assuming [redacted] of credit card revenues are hotel guests x Noe's standard hotel guest F&B discount: [redacted] = **Total credit card discount:** [redacted] → **Expected ceiling of credit users**

Expected discount volume charged to room: [redacted] + Expected maximum of credit card discounts: [redacted] = **Estimated ceiling of 15% off coupon revenue loss:** [redacted]

**Estimating the ceiling of discount usage [redacted], we establish the upper bound of discount volume which can be used to identify where discounting is excessive.**

Bar & Restaurant News, Omni Data

TROJAN CONSULTING GROUP

# Discount Strategy Improvements

# Hypothesizing regions and risks of discounts and fixing inconsistencies nationwide

## Key Insights and Risks

- [redacted]
- The remaining [redacted] likely stems from operational inconsistencies (e.g., excessive manager comps, miscoded discounts, excessive drink vouchers)
- High levels of price adjustments and open-item usage suggests staff may be modifying check totals
- These patterns create risks of uncontrolled margin erosion, inconsistent guest delivery, and limited ability to enforce discount policies across locations

## Alternative Discounting Methods

- Build room packages that include predetermined F&B credits, allowing for predictable losses that can be recovered through additional booking fees
- Introduce fixed-value dining credits tied to each stay so discounts can be consistent and tracked on POS
- Test time-bound promotions previously proposed that drive incremental revenue during off-peak periods rather than using percent off coupons
- Expand on current loyalty incentives by rewarding recurring visits with small, trackable free items

## Strategy to Mitigate Discount Revenue Leakage

### Diagnose

- Benchmark each hotels' discount mix against its expected ceiling
- Identify where discount keys are driving the variance in total discounts

### Standardize

- Consolidate POS buttons into a small set of clear, systemwide categories (e.g., "Manager Comp", "Hotel Guest 15%", "Amenity Redemption")

### Control

- Require manager PIN authorization for any non-standard discount
- Disable Open Item price edits except for common pre-approved use cases

### Educate

- Train staff on when and how to apply discounts prior to working the POS
- Implement feedback loops so each property can correct deviations

**Implementing a strategy to mitigate improper discount inputs can help reduce and categorize the ~$290K lost to unknown discounts.**

# Analyzing Noe's [redacted] of sales lost to discounts in the past 12 months and diagnosing the root causes

**Discount Amount by Item Category**

**Revenue Before Discounts vs. Revenue Kept ($)**

Redacted

**Diagnosing the Root Causes**

Redacted

**Most F&B categories and amenities align with standard discount behaviors, but the Open Item categories heavy discounting calls for restructuring and governance.**

# Implementing a systemwide strategy that ensures governance, profitability, and consistency

## Scalable Strategy for Reducing Discount Leakage

| | Standardize POS System Governance | Controlling Discounting per Category | Revenue Monitoring System |
|---|---|---|---|
| **Considerations** | • Open items lack structure, forcing servers to manually price items<br>• [redacted]<br>• Sporadic discount inputs increase Open Item revenue volume<br>• Different Omni locations use inconsistent POS mappings | • [redacted]<br>• [redacted]<br>• Discounts likely stem from sub-optimal non-happy-hour sales, beverage coupon offerings upon check-in, and server amenities | • Noé showed that abnormal revenue leakage can occur without structured monitoring<br>• Corporate currently lacks a unified dashboard to track discount behavior nationwide<br>• Every Omni location should enforce consistent governance |
| **Strategy** | • Standardize server-level Open Item entries per location to reduce POS discount misinputs<br>• Create a corporate POS template for all hotels with predefined SKUs, modifiers, and prices<br>• Train all locations on same POS | • Diagnose underperformers per subcategory (food vs. alcohol)<br>• Create a categorized standard recall policy to be deployed when a specific item is over discounted<br>• Remove generic discounts from all POS terminals nationwide | • Deploy a standardized discount integrity dashboard across properties and track uniform KPIs<br>o Include % discounts by category and open item rates<br>• Create thresholds that automatically trigger a review |

**LA's discounts reveal unsupervised POS inputs and excessive subcategory discounting, highlighting the need for a discount monitoring system to improve F&B performance.**

# National Training Diagnostics and Improvements

# Omni has different training practices across locations that should be standardized to improve efficiency and guest experiences

## Training Methods Across Locations

| | Los Angeles | Frisco At The Star | Fort Worth |
|---|---|---|---|
| On-Site | • Experiential continuity training preserves restaurant ambience during dining process<br>• Increase training of restaurant staff to assist with banquets | • Training on chef information and background teaches servers about dish's local roots<br>• Segmentation of customer types is taught during hiring | • Encourage upselling through server training sessions where they learn high margin items<br>• Train staff on "suggestive selling" to upsell and pair food |
| Policies | • Partnerships like Stance Coffee require Omni employee staffing with unspecialized training<br>• On-call staff get 3rd party training, so they should train at Omni locations as well | • Emphasis on staff asking questions or clarification if unsure to avoid order mistakes<br>• Strict dress and conduct rules maintain consistent dining experience and brand | • Make sure employees ask and understand guests' allergy risks and dietary restrictions<br>• Use tracking to quickly and effectively deliver room service options to rooms that order |

## Scalable Insights

- Omni Los Angeles struggles to staff their banquets, and on-call staff are less reliable than hotel specific staff
- The locations have different training materials and guidelines, forming discontinuity between each restaurant
  - Frisco's Yelp rating is the highest of the three locations due to their emphasis on asking questions
  - Frisco requires servers to articulate unique traits of each dish, improving the customer access to information

**Through improved training and policy continuity, like standardizing Omni policies to match Frisco's policies, customer experience quality can be improved.**

Omni Training Materials, Omni On-Site, Yelp

# Omni should target on-the-job training practices to ensure speed and consistency throughout the customer experience

## Starbucks Training Model

**Background**

- Starbucks uses the 70/20/10 onboarding approach
  - 70% on-the-job experience with supervision
  - 20% learning through feedback and mentorship
  - 10% training with e-learning and written modules

**Implications**

- Enables employees to get early on-the-job experience and be customer-facing
- Utilizing more person-to-person training creates stronger employee and manager relationships
- Omni must increase mentorship in their training

## Keys to Effective Training

- Positive recognition from managers during training and on-shift to training effectiveness as 64% of employees say it affects training retention
- Focus on mentoring new hires with experienced staff who can share location-specific training
- Minimize use of passive training such as written training modules, and only use them for reference

## Key Improvements

| Current Issues | Solutions |
|---|---|
| Training provides a large amount of information in short time | Incorporate frequent questions and training check-ins |
| Restaurant staff do not integrate well into the overall hotel ecosystem | Restaurant and hotel staff drive traffic to each other |
| Customer issues struggle to be dealt with by managers and staff | Utilize specialized conflict avoidance and de-escalation training |
| Hotel staff struggle to master restaurant training for franchises | Train Omni staff together with staff of the franchise |
| Long-term employees struggle to leverage newer technologies | Improve technology training and track use using digital metrics |

**By changing training to have better mentorship with leaders at restaurants and by minimizing passive trainings, Omni can reduce turnover and improve productivity of long-time workers.**

Cornell, Omni Data, Omni On-site, Yelp Reviews

# Developing specific staff training strategies to strengthen selling skill and product knowledge at Neighborhood Services

## Areas of Improvement of Training Schedule (Neighborhood Services)

### Narrative Selling

**Challenge:** “Salesmanship” is vague and upselling may invite pushy tactics contradicting values

**Recommendation:**
- Train staff to add personal stories when selling, showing their passion and knowledge

**Implementation:**
- Give specific examples in the training document and practical training/role-playing drills
- "As you're looking at our grill section, I have to recommend the steak. Our chef, Nick, is incredibly passionate about it.”

### Suggestive Selling

**Approach:** Beverage training is passive as it misses information on how to guide and upsell

**Recommendation:**
- Beverage programs are highly profitable and “guided selling” can improve average check size

**Implementation:**
- Train the 4-step journey: The Welcome (cocktail), The Pairing (wine by dish), The Refill, The Conclusion (espresso martini)
- Use scripts: "Since you chose the steak, our [house red] pairs perfectly. May I bring a glass?"

### Continuous Feedback

**Challenge:** Training ends with a quiz with no formal follow-up leading to rapid knowledge loss

**Recommendation:**
- Use spaced repetition and frequent feedback sessions to reinforce staff training

**Implementation:**
- Implement a 2-month follow-up plan: weekly check-ins for Month 1, bi-weekly for Month 2, and monthly for all employees
- 10-minute preshift to “micro-train” skills (e.g., role-play wine pairing), reinforcing training

**Omni should outline specific examples and scripts in training documents and during practical training while following up on performance with continuous feedback for staff members.**

Cornell, SevenFifty Daily, "NHS Frisco Training Guide 2017"

# Labor Efficiency and Management Benchmarks

# Building a data-driven BOH kitchen framework to integrate labor complexity into Omni's staffing and menu decisions

## Metrics to Determine Labor Complexity

**Cognitive Load**

Extent to which the item must be monitored or require expert judgement, skills, or personalization

**Logistical Complexity**

Number of key stations or pieces of equipment, and thus key bottlenecks, required to produce the menu item

**Instructional Complexity**

Quantifies the number of distinct and active tasks a chef must complete during service to complete the order

**Production-Time Effort**

Measures the amount of active hands-on time required from the cook to prepare the item during service

## Labor Management Plan

- Incorporate labor complexity into cover counts when scheduling staff, meaning shifts with a high proportion of complex items have additional staff
- Prep cooks can be cross-trained for items with low cognitive load, low service-time effort and high popularity (e.g., Cobb Salad or Sweet Gem Caesar)
- If a special menu item has a high complexity score, add temporary staff or adjust station allocation
- In addition to looking at popularity and profit margins for menu engineering, factor in labor complexity to identify high margin, low labor complexity items

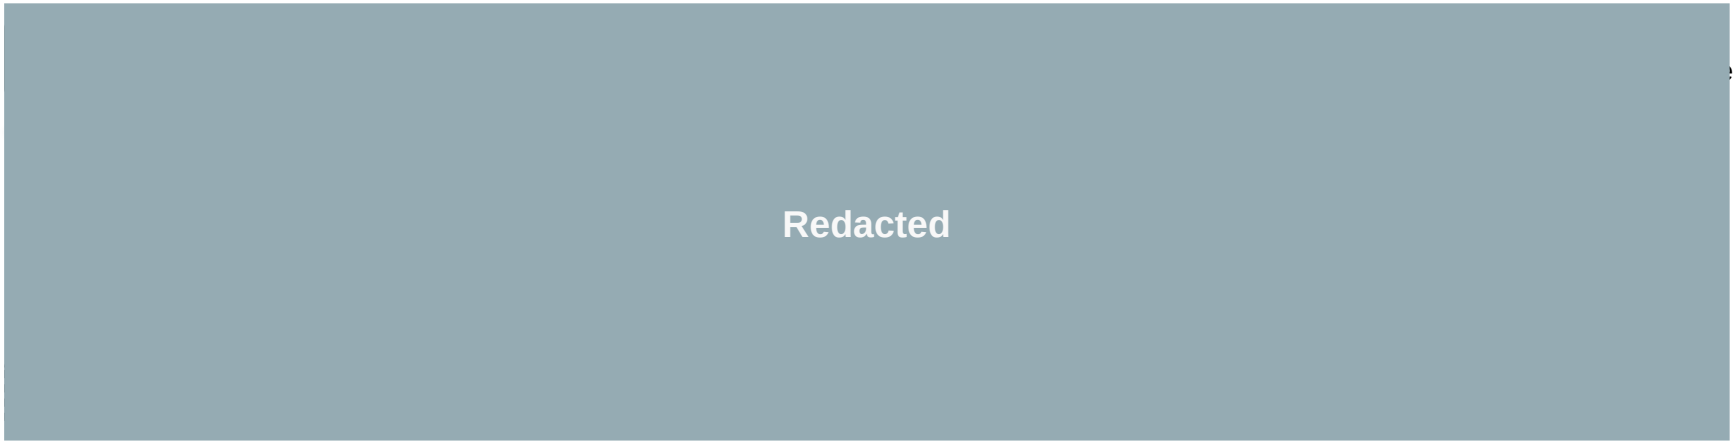

## Considerations and Prerequisites

- To scale this plan, all locations should compile instructions for how to make each food menu item
- Ensure the name of the dish on the menu aligns with the name of the dish in the database and instructions for straightforward data analysis
- To maximize impact, consider collecting additional data regarding time taken to make a dish, number of people involved in cooking, and sales count per hour

**Omni should standardize recipe documentation, align naming conventions, and collect time-and-labor data to optimize scheduling through labor complexity analysis.**

# Calculating labor allowance given prime cost targets to better allocate staffing for Omni's kitchen operations

**Labor Allowance** | **Sum of Sales Count by Day**

## Leveraging Staffing Tiers

**Tier 1**
- Reduce number of staff if shift has low labor complexity with low volume of sales
- Shift assigned to cross-trained or less experienced staff

**Tier 2**
- Most orders are cooked to order but with predictable processes and does not require technical expertise
- Staffed with mid-skill line cooks

**Tier 3**
- Shift assigned to experienced cooks who can manage multi-station coordination
- Justify higher labor allocation due to their technical demand

**Aligning labor allowance with item complexity and sales volume allows Omni to staff each shift efficiently while maintaining quality and profitability.**

3 Technology Implementation

4 National Discount Improvements

5 Labor Training and Tracking

**6 Customer Capture Strategies**

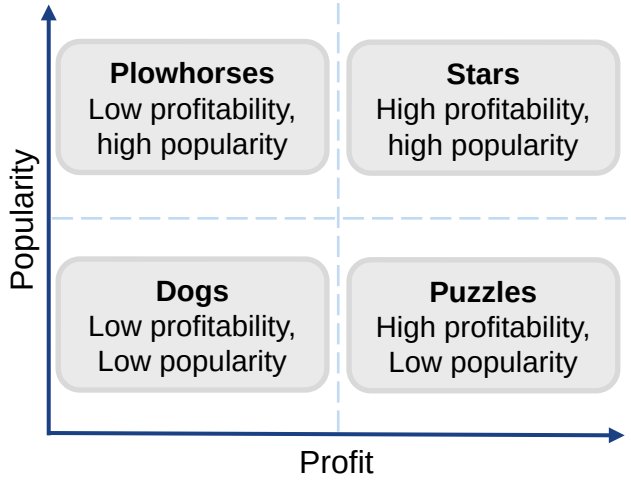

7 Summary & Implementation Timeline

8 Appendix

# Menu Engineering and Design

# Data-driven menu engineering framework can help optimize profitability and popularity

## Four-Quadrant Decision Framework

*High profitability = above average contribution margin
*High popularity = sales exceeds 70% of average expected sales share (100% / # of menu items)

## Recommendations by Quadrant

- **Stars** should be prominently featured, heavily promoted
  - They can be framed as chef recommendations and the restaurant brand should be built around these items
- **Plowhorses** require optimization due to low profits
  - If customers frequently leave food uneaten, reduce portion
  - Consider sourcing ingredients from lower-cost suppliers, modifying recipes to reduce cost, or increasing price
- **Puzzles** should undergo experimentation to prove potential
  - Restaurants should test whether puzzles can be salvaged through improved menu placement or staff recommendation
- **Dogs** should be taken off the menu as they fail both metrics
  - With the exception of using them as satisfactory options that enable large parties to agree on a dining destination
  - Some restaurants position dogs as high-priced decoys that make other items appear more attractive by comparison

## Long-Term Review

- Review fine-dining restaurants' menus semiannually due to high menu production costs and extensive staff retraining
  - Certain signature dishes should remain available while 20-40% of dishes can be rotated or changed seasonally
- Review upscale restaurants' menus quarterly to better respond to trends and adjust to changes in cost of ingredients
  - Upscale restaurants have faster meal pacing (60-90 minutes), allowing more experimentation with menu items

**Omni should use the menu-engineering framework to categorize menu items for different restaurants in order to improve margins and better align offerings with customer demand.**

# Redesigning the menu using behavioral insights to drive profitability and guest experience

## Updated Menu Design at Omni LA's Noe Restaurant & Bar

Placing high-priced items of each category at the top can shift customer spending 15-25% higher by establishing reference points for value and boosting perceived value

Customers' eyes first fixate on the center of the menu, then move to the top right corner, and finally to the top left.

Increased fixation duration directly correlates with selection probability

Make menu available online

NOE
restaurant & bar

OPENING ACT

L.A. Charcuterie Board 28
Locally sourced meats and artisanal cheeses | Baby vegetables | Fig jam | Olive tapenade | House-baked crostini

Sesame-Seared Ahi Sashimi 26
Locally sourced meats and artisanal cheeses | Baby vegetables | Fig jam | Olive tapenade | House-baked crostini

Caramelized Wild Mushroom Flatbread 24
Oven-fired | Toma cheese | Garlic aioli drizzle | Earthy seasonal blend

Noe Signature Wings 20
Kimchi ranch | Orange-scallion salad | Chili glaze for a citrus kick

Popcorn Chicken Bites 20
Crispy free-range chicken | Local honey-mustard glaze | Shaved fennel slaw | Blue cheese crumble

Grilled Salmon Crab 24

AFTER-PARTY

Caramel Flan Cheesecake 15
Velvety dulce de leche | Candied praline crunch | Fresh strawberries

Chocolate Mousse Cake 15
Kirsch cherries | Chocolate curls | Vanilla-bean whipped cream

Margarita Meringue 15
Graham cracker crust | Coconut | Blueberry-lime compote | Toasted meringue peaks

Limit menus to three font styles maximum as more than three dilutes the drawing power and creates visual confusion

Descriptive menu labels (geographic labels, sensory language, and preparation methods) increase sales by 27% compared to basic labels

Adequate white space reduces cognitive load by 20-30%, making decision-making easier and suggesting premium quality

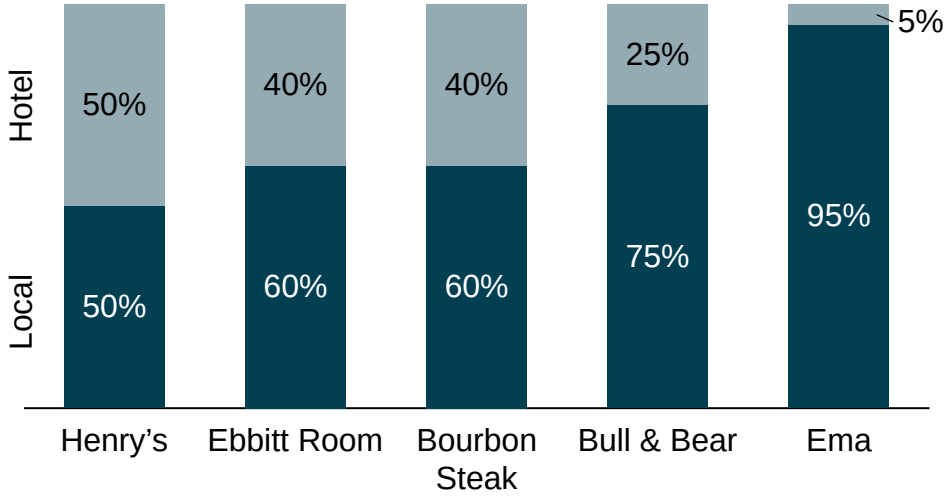

**Omni should strategically design their menu through descriptive labeling and visual hierarchy to increase sales of high-margin dishes.**

# Local Guest Capture

# Top performing hotel restaurants reveal that >50% of diners are locals, not hotel guests

## Local vs. Hotel Guest Mix at Hotel Restaurants

**Reported by restaurant GM or staff*

Omni relies heavily on in-house guest capture, yet some of the strongest hotel restaurants are driven by local demand

Partnering with influential chefs or established restaurant groups can help establish credibility, increase local draw, and distinguish hotel restaurants in a competitive market

## Key Takeaways

- These five restaurants featured in OpenTable's 2025 Top Hotel Restaurants all reported high local capture, with Ema reporting almost all diners are locals
- Bull & Bear sees higher hotel guest capture during convention season, yet out of season locals rise to ~75%, keeping revenue consistent year-round
- Each restaurant has a distinct draw
  - **Ema** and **Bourbon Steak**: Partnerships with acclaimed chefs and restaurant groups drive local credibility
  - **Ebbitt**: Farm-to-table authenticity via Beach Plum Farm drives strong word-of-mouth and retention
  - **Bull & Bear**: Repeated visits just for specific tableside carved items
- Other, like Lido (50% locals), succeeded by intentionally building a space that leverages a view, a key consideration when developing concepts from scratch

**To see success similar to these top performers, Omni must refocus on local capture and intentionally apply these differentiators when developing future concepts.**

Bourbon Steak GM, Bull & Bear Ast. GM, Ebbitt Room GM, Ema GM, Henry's HR, Lido GM

TROJAN CONSULTING GROUP

# Omni's strategy to attract non-hotel guests should focus on granting locals unique perks that cannot be purchased

## Branding Strategies for Locals

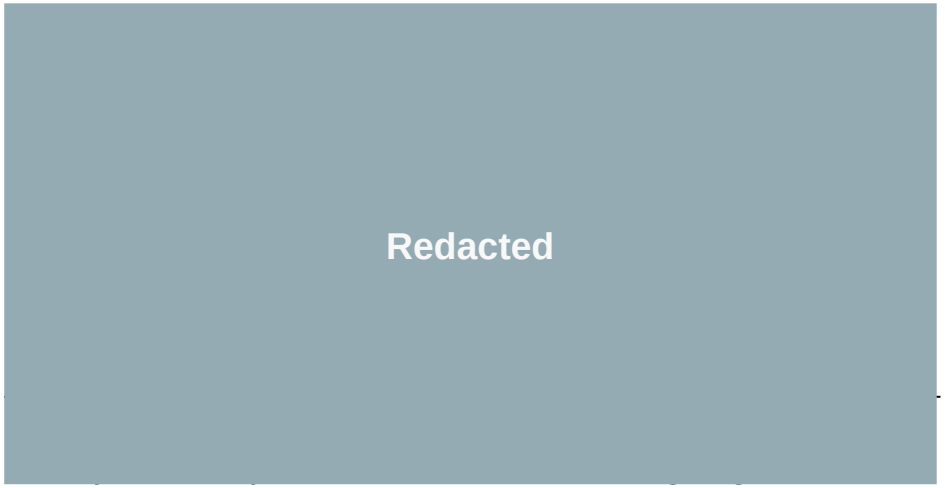

- Omni can create behavioral incentives rather than monetary ones to draw in local diners that might not otherwise visit
- On usi ec

| | Core Collection | Resort Collection | Convention Collection |
|---|---|---|---|
| **Issue** | • Primary competition is high-end, standalone restaurants<br>• Many other established options within walking distance | • Locals view the resort as a high-cost special occasion spot<br>• Deem is as too far and inconvenient for regular dining | • Perception that the restaurant is for convention attendees.<br>• High volume of attendees may feel overwhelming for locals |
| **Strategy** | • Create opportunities to try Omni food in places like corporate lunch and catering<br>• Offer convenience without the hassle of a busy downtown | • Grant locals exclusive access to luxury aspects that average travelers pays high prices for<br>• Leverage resort amenities as an extra differentiator | • Establish the restaurant as high-quality dining that is not crowded by convention crowds<br>• Have a clear distinction from convention banquet meals |
| **Actions** | • Establish large-scale catering options for enterprises and corporate companies downtown<br>• Exposing the restaurant name to locals will increase brand exposure and likeliness to visit | • Create weekday discounts on locally inspired drinks to make items more price friendly<br>• After a number of restaurant visits, locals earn a free hour to amenities like the spa or golf | • Offer discounted days for locals if they show their local ID on non-convention days<br>• Create a distinct section for local diners to access upon request to create privacy |

**Omni should attract local diners by replacing monetary discounts with behavioral incentives, such as leveraging urban convenience and granting exclusive access to resort amenities.**

# Holiday revenue spikes reveal opportunities to grow high-margin days and boost beverage activations on weaker holidays

## Total Revenue Generated on Holidays at Noé ($)

## Noé Trends

- Valentine's Day accounts for 10% of total February revenue, with 110 recorded orders of the Surf & Turf special (~$10K)
  - Confirms themed specials that are limited on holidays can meaningfully lift both revenue and order volume
- Mother's Day also makes up 8% of total May revenue with ~$9.4K from 99 recorded orders of the Mother's Day Adult—likely a prix fixe menu or brunch offering
- Both holidays experienced lifts in beverage revenue and volume through paired drinks

## Scalable Takeaways

- Prix fixe menus and themed offerings materially increase spend for both Valentine's Day and Mother's Day and show high beverage participation, demonstrating the need to replicate this lift across smaller, less traditional holidays
  - Prix fixe creates simplicity for diners, lowers food costs, improves quality consistency, and streamlines preparation
- Identify holidays in restaurants' low performing months (e.g., St. Patrick's at Noé bar can help March's performance)
- Bars can target beverage-centric holidays (e.g., Cinco de Mayo, St. Patrick's, 4th of July) which show little lift at W&R
- Create prix fixe that include a starter, entrée, dessert, and drink pairing for smaller holidays and create limited-time holiday drinks (e.g., Spicy Mezcalita for Cinco De Mayo), as well as NA drink options to appeal to all guests

**Omni can boost local revenue on currently flat holidays by expanding prix fixe menus and creating pairing bundles aligned with each holiday's beverage culture.**

# Optimizing Loyalty Programs

# Strategic cultural and loyalty-driven partnerships can acquire new high-value customers

## The Kessler Collection

**Background**
- Kessler hotels often feature dedicated art galleries
- Host events like the painter tours, where guests book rooms just to attend the hotel's art galleries

**Implications**
- Art events draw in local residents and cultural tourists who might not otherwise visit the hotel
- This foot traffic generates sales within other services

## Art Partnerships

- Exhibitions and artist receptions establish the hotel as a cultural hub, attracting high-net-worth patrons
- The average attendee at an arts and culture event spends an average of $38 on top of booking, with international attendees spending around $60
- Patrons may then become regular dining or event clients, helping boost F&B and banquet revenues
- Omni can leverage their destination art pieces to organize art viewing events and offer catering

## Capital One x Preferred Hotels

**Background**
- Capital One miles are converted into Prefer points
- 1,000 Capital One miles → 2,000 Prefer points

**Implications**
- Partnering with a credit card companies grants hotel chains direct, low-cost access to existing customers whose loyalty has already been captured by banks
- Omni can also obtain their own select loyalty guests

## Traffic & Loyalty

- Many travelers are loyal to their bank's reputation and points but not to a specific hotel brand
- Over $40B in rewards were earned by consumers from major credit cards companies in 2022
- Can drive massive first-time loyalty enrollments and establish Omni as a credible redemption option
- Partnerships are a cost-effective customer acquisition channel that provides powerful incentives to create both long-term revenue and brand affinity

**Both art-focused cultural programming and credit card loyalty programs generate low-cost customer acquisition by creating incentives for first-time bookings.**

Americans for the Arts, Consumer Finance, Convention South, Nerd Wallet

# Implementing culinary experiences into the pre-existing loyalty program allows Omni to stay competitive

## Select Guest Loyalty Program

- Currently offers industry standard, tiered benefits via complimentary items and free nights for points
- Benefits improve at higher tiers (e.g., improved complimentary upgrades and drinks), but currently lacks the depth found in modern luxury programs
- Lacks experiential rewards (e.g., dining credits, curated stays) that resonate with luxury travelers
- While consumer preferences continue to change and transform, guest loyalty programs should also be adjusted to cater toward new trends and tastes

## Marriott Bonvoy

**Background**

- Offers exclusive culinary and drink experiences at all hotels (e.g., interactive dining with chefs)
- Retention for those who redeem these rewards are 25% greater than those who use points for free stay

**Implications**

- Motivates guests to sign up for loyalty programs and dine in-house, ultimately improving capture rates
- Create loyalty with the next generation of travelers

## Potential Impact

| | | | | |
|---|---|---|---|---|
| Positions Select Guest as a lifestyle driven loyalty ecosystem, capable of catering to new dining trends | Increases on-property dining capture by motivating guests to spend more for exclusive culinary access | Targets a significantly large and growing traveler segment through sociable, memorable dining experiences | Differentiates Omni from lagging competitors by offering perks and opportunities exclusive to each hotel's location | Improves traffic and spend, even at underperforming properties by attracting experience-seeking travelers |

**By integrating exclusive F&B experiences into the Select Guest Loyalty Program, Omni can deepen guest retention, increase on-property spend, and strengthen brand differentiation.**

# Loyalty program should focus on restaurant rewards in addition to free room rewards

## Implement Loyalty Point Redemption at Restaurants

- Customers will be more likely to interact with Omni restaurants between stays to earn and spend their points
- Free deals from point usage can improve customer satisfaction and brand image, and free meals can be redeemed over 3 times more often than rooms, indicating greater and more frequent interaction with the loyalty system
- Competitors such as IHG integrated point redemption options across their food and beverage outlets, whereas Omni's current room-only redemption model limits engagement opportunities and weakens its competitive positioning
- Points spent at restaurants should be valued comparably to room spend points to prevent excessive losses, Omni should value their points between $.005 and $.01 per dollar spend to align with industry standards

### IHG Rewards

**Background**

- IHG rewards uses a points-based system to incentivize a greater number of stays and spend
- Promises rewards events with special deals and points multipliers and no blackout days

**Implications**

- Points system makes customer feel like they are getting value, and the point system keeps spending concentrated in-house at IHG hotels
- Points are valued at $0.006 per dollar spent, which remains comparable with similar hotels in the market

### Increasing Omni Facility Spending

- Use promotions like double point nights on low-traffic restaurant times to increase restaurant occupancy and spending during off hours
- Repeat restaurant customers should be able to earn progressively more points for each successive time they dine, encouraging repeats across visits
- Implementing a system where higher loyalty status members earn reduced wait times for tables could further increase interest in higher rewards tiers
- Offer special rewards bonuses on high margin menu items to encourage customers to purchase more profitable food and beverage options

**By letting rewards customers use their points at restaurants, Omni can induce greater restaurant traffic and spending while also giving customers greater rewards flexibility.**

# On-Property Marketing Strategies

# Capturing guest attention inside the hotel accelerates their path from awareness to dining without relying on digital channels

## On-Property Marketing Touchpoints

- On-property marketing touchpoints address the guest at the moment of decision and in the context of convenience
- By engaging the captive audience, Omni shortens the decision path from "I could eat here" to "I should eat here."

### Table Tents

- Restaurants using table tents report an uptick in sales for promoted items
- Strategically place tents in room desks, the lobby, lounge coffee tables, and at the concierge and guest services center
- Use a 4″x6″ or 5″x7″ double-sided format for maximum promotional space
- Use large, legible type (minimum 18-22 pt), one hero image (signature dish or drink), and limit to maximum 3 messages
- Use dynamic QR codes to update daily specials without reprinting materials
- Put the QR code on the bottom right of the front face with a 1-2 incentive lines to get guests to scan the menu
- Change tent every 2-4 weeks to rotate menu items and seasonal dishes

Headline appeals to guests' desire for a good time, suggesting an opportunity to grab a drink on property

The image communicates the premium crafted drink

Messaging encourages the guest to look through the list and signals to the guest the depth of offerings

QR code menus can increase check averages by $2-4 because guests feel more comfortable exploring and customizing items at their own pace

**Strategically placed table tents with evocative language and scannable QR codes facilitate easy exploration and awareness of in-house F&B options to guests.**

# Capturing guest attention inside the hotel accelerates their path from awareness to dining without relying on digital channels

## On-Property Marketing Touchpoints

- On-property marketing touchpoints address the guest at the moment of decision and in the context of convenience
- By engaging the captive audience, Omni shortens the decision path from "I could eat here" to "I should eat here."

### Elevator Posters

- People in a confined elevator are more likely to notice and retain messages
- Use 11″×17″ framed posters and matte or semi-gloss finish poster paper to minimize glare under elevator lighting
- Include a high-resolution photo of a signature dish, cocktail, or interior space, taking up ~40-50% of the poster
- Headline should have a short, compelling promotional line
- Add supporting text, 1-2 lines of detail (e.g., available 5-9 PM in the lobby)
- Use a very clear call to action, such as “reserve now at the front desk”
- Promote limited edition and seasonal menu items to create a sense of novelty and urgency to try exclusive offerings

The title uses an elegant, script with a rich red color reinforcing the theme of a premium and bold experience

Uses industry-recognized terminology to instantly convey the highest standard of beef quality to guests

Before the guest even reads the headline, their eyes are drawn to the food, creating a desire to try the food, making the text even more compelling

Suggesting a reservation creates a sense of high demand, subtly encouraging the guest to book immediately

**Elevator posters that use high-impact imagery and simple messaging can convert a guest to seek out Omni dining during idle moments.**

# Server Selling Strategies

# Offering food pairing bundles can drive greater revenue by incentivizing upselling through larger purchases

## Entree Pairings

### Drink

- Alcohol has margins between 60-80%, so bundling wines with meals will still keep revenues high while increasing purchases
- Offer pairing directory on wine menu to highlight wines that pair well with certain dishes
- Show sommelier picks on wine menu for additional drink pairing

### Appetizers

- Train servers to recommend certain appetizer options based on the food genre of the entrees
- Contrast options, like fish appetizers with beef dish or sweet appetizer with savory dish, make dining memorable
  - Offer contrast option bundles on menu for a discount

### Dessert

- Offer pairings so that seasonal dessert offerings match with seasonal entrees options
- Desserts should be highlighted by staff during entree selection and during service check-ins to improve pairing likelihood
- Small number of offerings make bundling critical to raise demand

## Outcomes

- Effective pairings improve customer experience satisfaction and induce repeat restaurant customers
- Research has shown up to 50% increase in wine sales through explicit recommendations of pairings
- Average check size increases by up to 15% through effective upselling pairing strategies
- Expert recommendations will increase demand most notably for business and wealthy leisure travelers

## Employee Incentives

- Reward servers on upselling, ensuring that they push customers to try new pairings each time they dine by giving commission bonuses for each bundle
- Servers should match flavors so that when entree is purchased they recommend effective pairing options that align with the same flavor profiles
- Track employees that sell the most of each bundle type and reward them at the end of each month

**Encouraging pairing across menu categories through improved server training will lead to greater dish sampling and in-turn greater revenues.**

JEFN, NIMH, Omni Data

# Noé, a food-driven restaurant, can reference this condensed sample beverage menu to drive bar performance

Removes inefficiency of choosing and pricing a drink when guests ask to "surprise them", and also encourages purchases

Non-alcoholic (NA) drink demand is rising, while share of Americans who drink alcohol is declining by about 4% each year

Must include a NA section with high-quality options that prioritize quality and presentation

Consider using "non-alcoholic drinks" over "mocktails" as "mocktail" may feel like an inferior imitation and outdated

NOÉ
BAR

**Chef's Pick** $16
A rotating weekly creation designed by our bar team

**SIGNATURE COCKTAILS**

**Noe Martini** $17
*Crisp, spirit-forward martini with bright citrus and a smooth, clean finish*

**Strawberry Rhubarb Margarita** $18
*Fresh strawberry and tart rhubarb balanced with citrus and agave for a vibrant margarita*

**Spice Girl** $16
*A bold, chili-kissed cocktail with citrus, subtle heat, and a refreshing, lifted finish*

**NON-ALCOHOLIC CREATIONS**
Crafted with the same approaches as our standard beverages

**Pomegranate Hibiscus Cooler** $11
*Bright pomegranate and hibiscus with notes of red apple and rose. Light bubbles, crisp, and a clean, refreshing finish*

**Citrus & Herb Gazoz** $11
*Fresh citrus and muddled herbs with floral aromatics. Zesty and lightly sweet.*

**Ginger-Apple Tepache Fizz** $10
*Naturally tangy ginger and apple with subtle spice. Carbonated with a flavor profile similar to a dry, zero-proof cider*

**CHEF'S PAIRINGS**
Designed to elevate our popular dishes through curated beverages

DRY AGED NY STRIP ($46)
+ *Bramble On ($18)*
+ *Franciscan Estate Cabernet Sauvignon ($18)*

FLANK STEAK & FRIES ($38)
+ *Banfi Chianti Classico ($16)*

ROASTED CHICKEN ($34)
+ *Strawberry Peppercorn Gin & Tonic ($18)*
+ *Mannequin by Orin Swift Chardonnay ($24)*

ROASTED SALMON ($42)
+ *Pine Ridge Chenin Blanc-Viognier ($15)*
+ *Aperol Spritz ($16)*

**SEASONAL SPECIALS**

**Maple Old Fashioned** $18
*Warm maple sweetness with bourbon spice*

**Cranberry Moscow Mule** $16
*Tart cranberry and bright ginger with lime for a festive mule*

**Pear & Rosemary Spritz** $10
*Light pear and herbal rosemary with a clean, sparkling finish*

Chef pairings direct toward high-margin beverages and can be referenced whenever a diner selects an entrée

Can consider making this a bundle and save option

Descriptions elevate beverage appeal and reduce guest uncertainty

*Built from drinks identified in sales data and current offerings, intended to be alongside full wine list*

**Noé can boost beverage sales by adding an extensive non-alcoholic section, by including chef's parings, and by clearly updating seasonal specials.**

4 National Discount Improvements

5 Labor Training and Tracking

6 Customer Capture Strategies

**7 Summary & Implementation Timeline**

8 Appendix

# Summary of Key Strategies Proposed

# Omni can focus on these three main strategies to drive financial infrastructure organization and reduce loss

## Summary of Foundational Systems and Governance Strategies

| | POS Restaurant365 and ClearCOGS Installation | Pricing Updates Conducted Quarterly | Discount Governance and Tracking |
|---|---|---|---|
| **Revenue Shift** | • Potential 2–7% long-run revenue lift through improved pricing precision, reduced waste and loss, and accurate category-level tracking | • Potential 1–2% revenue lift by aligning prices with demand peaks, brand value, cost changes, and competitors<br>• Does not require new diners | • Recovers existing revenue<br>• Noé's >$290K leakage is correctable, similar governance at scale can recover six-figure margins |
| **Labor Effect** | • Needs a corporate admin and minor on-site access during installation, no added restaurant staff needed<br>• Quarterly data reviews can be part of manager workflow | • Minimal FOH labor changes<br>• Needs review cycles each quarter (corporate manager), similar to POS upgrade<br>• Menu/POS updates require change but no labor change | • Requires corporate-led policy and ongoing oversight for acceptable discount types<br>• FOH training for discount use<br>• Restructure POS Open Item category to prevent misuse |
| **Potential Risks** | • High startup/reoccurring costs, quote needed for exact<br>• Under-deployment (<6 properties) delays ROI<br>• Inaccurate or incomplete data entry neutralizes benefits | • Price changes (>15% adjustments) may erode perceived fairness and weaken positioning<br>• Poor communication may cause server confusion | • Reducing discounts like beverage vouchers abruptly can be received negatively<br>• Staff may continue discount attempts through manual comps unless rules enforced |

**These three strategies can build Omni's financial infrastructure without staff increases; however they will require enforcement and frequent analytics.**

# These three analyzed strategies can allow Omni to drive revenue per person at restaurants

## Summary of Strategies to Increase Guest Spending

| | Bundle and Pairing Option | Remove Weak Items and Anchor Entrees | Seasonal and NA Beverages |
|---|---|---|---|
| **Revenue Shift** | • Potential 3–6% check-size lift through combinations that reduce decision friction and normalize premium choices<br>• Boosts beverage purchase | • Shifts volume toward profitable dishes and reduces losses from weak sellers<br>• Mid-tier upsell opportunities and ingredient consolidation | • Increases beverage spend<br>• NA beverages can drive revenue from guests that do not drink alcohol without cannibalizing alcohol margins |
| **Labor Effect** | • Little labor effects, FOH requires pairing language<br>• BOH prep is standardized and often becomes easier than à-la-carte variability<br>• Menu changes needed | • Requires additional short-term item performance tracking and BOH item removal or recipe changes<br>• Long-term labor neutral once new menu is adopted | • Periodic training for bar and FOH teams on recipes<br>• Batching saves labor<br>• FOH training required for NA beverage positioning, but no additional staff needed |
| **Potential Risks** | • Little effect if bundles include low-margin items or are priced close to à-la-carte<br>• Bundles reduce perceived quality if not done correctly and positioned well on menus | • Removing staple dishes may not be received well<br>• Excessive testing of new dishes puts brand identity at risk and disrupts kitchen flow<br>• Not monitoring erodes benefit | • Higher ingredient costs and unpredictable demand may create spoilage in short-run<br>• Drink price may exceed price tolerance and menus must be updated seasonally |

**Omni can use these strategies to raise contribution margin per guest without needing to increase guest volume.**

# Omni can utilize on these two proposed strategies to drive repeated guest visits

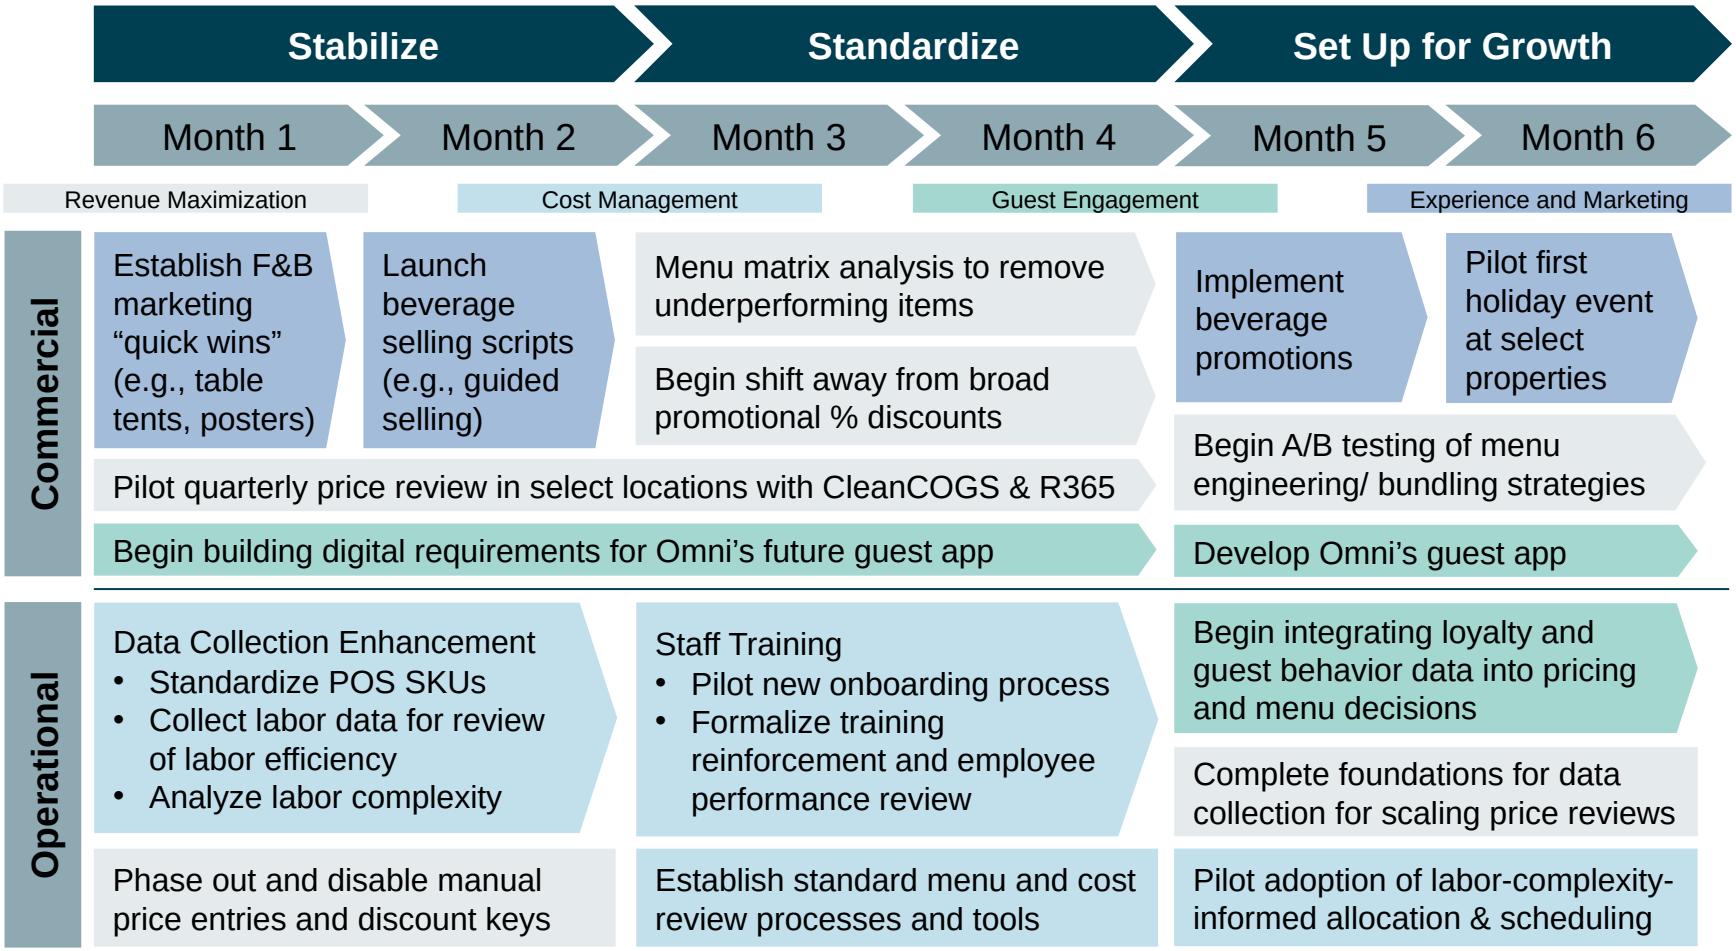

## Summary of Guest Frequency Strategies

| | Loyalty Program Points at Restaurants | Holiday Prix-Fixe |
|---|---|---|
| **Revenue Shift** | • Drives recurring spend by converting hotel guests into recurring restaurant diners<br>• Allowing points to increase without room charges captures off-stay dining<br>• Tiers and point valuation at $0.005–$0.01 higher annual spend from enrolled members | • Potential 8–15% revenue lift on fixed dates and can additionally be paired with holiday-specific events, activations, or beverages<br>• E.g., Noe's Valentine's Day produced $18.9K total revenue with $9.9K (53%) coming from a single prix-fixe option at ~$90/guest |
| **Labor Effect** | • Initial FOH training required to ensure point accrual and redemption accuracy is shared<br>• After implementation, program administration is digital and scalable without additional staff<br>• Oversight of earning rules for property adoption | • Most labor requirements occur before (menu planning and marketing), with less on event day<br>• FOH staffing must increase to match guest peak surges however prix-fixe simplifies BOH prep through predictable orders |
| **Potential Risks** | • Improper point valuation (both over- and under-value) becomes a financial liability<br>• Overvalued points cut at restaurant profit<br>• Undervalued points can make rewards feel unattainable and redemption lacks value, reducing participation and impact | • New dishes and ingredients are susceptible to spoilage if demand forecasting is inaccurate<br>• Insufficient marketing will cause prix-fixe to only replace regular orders rather than drive diners<br>• Overuse will decrease perceived exclusivity making holiday menus feel routine, not special |

**Omni can create repeatable demand through loyalty point changes and holiday specials to increase visit frequency without major labor expansion.**

# Implementation Timeline

# Six-month roadmap to stabilize operations, standardize systems, and enable sustainable F&B growth nationwide

**This phased plan builds strong commercial and operational foundations, unlocking consistent pricing, improved efficiency, and scalable revenue opportunities across all Omni properties.**

# Scalable national framework to expand Omni's F&B strategies across diverse property types

## Steps to Scale Nationwide

| Revenue Maximization | Cost Management | Guest Engagement | Experience and Marketing |
|---|---|---|---|
| • Build a playbook on menu engineering, discounts, and pricing to pilot and distribute nationwide<br>• Continuous review | • Phased onboarding and integration of new POS analytics tools and labor allocation and scheduling analysis | • Pilot digital ordering system and guest app in select properties<br>• A/B testing and integrate data to improve system | • Determine niche and most profitable holiday nationwide<br>• Launch new marketing channels with new guests and diners |

## Key Considerations When Scaling

| | | | |
|---|---|---|---|
| • Regional elasticity varies, affecting the extent of impact on prices and discounts<br>• Different hotels require different discount logic<br>• Menu review cycles must account for varying menu printing costs across locations | • Older properties will need more phased onboarding and strong IT compliance to prevent local overrides<br>• Regional cost structures (produce, proteins, alcohol laws) require POS price logic flexibility | • Local repeat patterns differ (weekly regulars at restaurants vs seasonal visitors)<br>• Space and operational capacity differ, limiting properties that can support loyalty perks<br>• Digital adoption varies among guests | • Holiday demand varies due to different local community preferences and demographic<br>• Marketing channels perform differently depending on restaurant tier and hotel archetype |

**This framework helps Omni ensure each strategy can scale nationwide while adapting to regional demand, property constraints, and varying guest behaviors.**

# Omni should follow the following four steps to be executed to build a strong foundational system

## Immediate Next Steps

### Standardize Data Foundations

**Justification:** All recommendations rely on accurate and consistent data before scaling nationwide

Standardize data structure across all properties by using identical columns, formats, and precision
Enforce uniform naming and data-entry rules for menu items, SKUs, modifiers, and discounts to eliminate local variations and maintain clean, reliable national datasets for consistent data collection and reporting

### Pilot Commercial Playbook

**Justification:** Pricing and discount structure will be the biggest revenue drivers across all properties

- Onboarding of restaurant managers for Restaurant365 and CleanCOGS for menu engineering and pricing analysis to ensure seamless adoption and transition
- Detail best practices for bundling, pairings, and discount structure to guide execution
- Consolidate and standardize POS discount buttons

### Active Marketing and Beverage

**Justification:** Quick methods to increase traffic and revenue while foundational systems are being fixed

- Place table tents, QR code menus, and seasonal elevator posters with recommended templates
- Roll out beverage guided selling prompts and updated training documents for staff members

### Design Loyalty Program and App

**Justification:** Design loyalty program and app features to better align with future pricing and guest data systems

- Select 3 pilot properties and map data flows with Restaurant365 and CleanCOGS so the loyalty program and app can be built on accurate, scalable inputs once foundational systems are stabilized

**These prioritized actions establish the data, pricing, marketing, and digital foundations Omni needs to scale F&B strategies nationwide with consistency.**

# Further Investigations

# Our project has highlighted many solutions and opportunities to improve, but we believe there is more to consider

## Project Highlights

### Identify Current Gaps

*Assessed pain points across guest capture, guest spending and operations*

### Explore Solutions

*Refined existing processes and discovered new opportunities and partnerships*

### Prioritize and Track Results

*Identified relevant metrics and highlighted solutions to prioritize and implement*

## Future Considerations and Project Experience

- Technological enhancements are necessary to stay consistent with competitors and cut unnecessary expenses
  - Beyond digital interface improvements and AI pricing software, we believe there is an opportunity to investigate AI scheduling software to optimize the workforce for every given day and lighten the load on local management, especially when paired with our AI item complexity score prompts that can evaluate menu item complication.
- National improvements are only as good as their local counterparts putting them into action; A focus towards surprise visits from corporate F&B employees or undercover reviewers could be the only successful way to check on new implementations and find inconsistencies at each individual location, unless new overview technologies are used
- We learned a lot about the unique complexities of the F&B industry, especially about the difficulty of connecting the corporate level to local restaurants and exploring their complexities and unique issues to build scalable roadmaps

**Sustained progress will depend on pairing new technologies with reliable, location-level follow-through to ensure consistent quality and prevent revenue leakage.**

# AI Labor Analysis Template

# Omni should adopt a consistent labor complexity rubric to improve BOH efficiency and staffing decisions

## AI Prompt to Assign Labor Complexity Score

**ROLE:** You are an expert AI Restaurant Operations Analyst, specializing in labor management.

**GOAL:** Your task is to analyze every provided menu item's at-service procedure and assign it a BOH Labor Complexity Score (LCS) based on the official 4-metric rubric. You must be objective, consistent, and follow the rubric precisely.

**OFFICIAL SCORING RUBRIC:** You will score the item from 1 to 5 on these four metrics.

1. **Procedural Complexity:** *This measures the number of distinct actions a chef must perform at-service. Do not count prep steps.* **1 (Low):** 1-3 simple steps (e.g., scoop, garnish). **3 (Medium):** 4-6 distinct actions (e.g., season, sear, plate). **5 (High):** 7+ distinct actions (e.g., multiple components, blending, straining, plating).
2. **Production-Time Effort:** *This measures the amount of active hands-on time required from the cook to prepare the item during service.***1 (Low): 100% Assembly.** All components are pre-prepped. The cook only assembles or plates. (e.g., items with dressing or dip like Nachos). **3 (Medium): Hybrid / Reheat.** Key components are pre-cooked/prepped, but it requires an "à la minute" reheating or cooking step. (e.g., Meatballs - pre-cooked, then fried; Brussels - pre-roasted, then sautéed). **5 (High): 100% "À la Minute".** The main ingredient starts *raw* and is cooked from scratch. (e.g., Fish and Chips - raw fish; Salmon, Steak Frites - raw protein).
3. **Station & Equipment Load (Instructional Complexity):** *This measures how many key stations or pieces of equipment are required.* **1 (Low): Single, Non-Bottleneck Station.** (e.g., cold station, plating station). **3 (Medium): Two Stations or One Key Bottleneck.** (e.g., ties up one high-demand station, e.g., fryer, sauté). **5 (High): Multi-Station Bottleneck.** The item ties up multiple critical pieces of equipment. (e.g., sauté, then oven, then plating)
4. **Skill & Attention (Cognitive Load):** *This measures the "babysitting" or expert judgment required. Can a new cook do it, or does it need a top-tier cook?* **1 (Low): Low Skill ("Fire-and-forget").** Relies on a timer. Hard to mess up. (e.g., boil for 2 mins). **3 (Medium): Medium Skill (Monitor).** Requires following a procedure and watching for visual/audio cues. (e.g., "start to caramelize" or "fry till Internal 165"). **5 (High): High Skill ("Feel").** Relies on judgment, timing, and expertise. Easy to ruin. (e.g., "Cook desired temp," "rest... one temp below").

**YOUR TASK:** I will provide the Item Name and Procedure steps. You will analyze the procedure, score it on all four metrics, and calculate the final_BOH_LCS which is the average of the four metrics (rounded to one decimal).

**OUTPUT FORMAT:** You MUST return a table with the 4 metrics as the column headers and the item names as row names.

**MENU ITEMS AND PROCEDURES:**
*(PASTE THE ITEMS AND THEIR PROCEDURES BELOW)*

Can be directly pasted into ChatGPT or Gemini (both have been tested)

# Break down labor complexity (BOH) to identify which menu items require the most skill, time, and coordination

| Labor Complexity Example (Neighborhood Services) | | | | | |
|---|---|---|---|---|---|
| **Item Name** | **Procedural Complexity** | **Service-Time Effort** | **Logistical Complexity** | **Cognitive Load** | **Labor Complexity** |
| **Brussels** | 5 | 3 | 3 | 3 | **3.5** |
| **Burger** | 5 | 5 | 5 | 5 | **5.0** |
| **Caesar with Shrimp** | 5 | 1 | 1 | 1 | **2.0** |
| **Cobb** | 5 | 1 | 1 | 1 | **2.0** |
| **Fish and Chips** | 5 | 5 | 3 | 3 | **4.0** |
| **Fried Chicken Sandwich** | 5 | 5 | 5 | 3 | **4.5** |
| **London Broil** | 5 | 5 | 3 | 5 | **4.5** |
| **Meatballs** | 5 | 3 | 5 | 3 | **4.0** |
| **Nachos** | 5 | 1 | | | **2.5** |
| **Salmon** | 5 | 5 | | | **5.0** |
| **Sea Salt Fries** | 5 | 3 | | | **3.0** |
| **Steak Frites** | 5 | 5 | | | **4.5** |
| **Wedge with Chicken** | 5 | 1 | 1 | 1 | **2.0** |
| **Wedge** | 5 | 1 | 1 | 1 | **2.0** |

- 7+ distinct actions
- Steak (main ingredient) starts raw
- Only requires grill and plating station
- Relies on judgment, timing, and expertise as it is “cook(ed) to guest’s desired temperature”
